## Introduction and Overview

## Overview

The Smarter Balanced Assessment Consortium's (Smarter Balanced) Assessment System includes a set of balanced components that are designed to meet a diversity of students' needs across all of the Consortium's members. This system provides valid, reliable, and fair assessments of the deep disciplinary understanding and higher-order thinking skills increasingly demanded by a knowledgebased global economy. The system is based on the belief that assessment must support ongoing improvements in instruction and learning experiences for students that lead to outcomes valued by all stakeholders. Smarter Balanced supports the goals of its members who seek to ensure that all students leave high school prepared for postsecondary success in college or a career through a planned sequence of educational experiences and opportunities. The system was grounded in the strong foundational assessments, policies and procedures of its members including supports and resources from institutions of higher education (IHEs) and workplace representatives. The Consortium expanded on these proven successes to create a high quality, balanced, multistate assessment system based on the Common Core State Standards (CCSS) in English language arts/literacy (ELA/literacy) and mathematics.

The Consortium's staff provide expert guidance and facilitate member driven decisions regarding the maintenance and enhancement of the system as required to fulfill its mission to improve teaching and learning. Smarter Balanced members retain flexibility regarding how to customize the system so that it may best be used as part of their approach to improving their local educational systems. The Consortium's assessment system strategically uses of a variety of item types including performance tasks to measure the full range of the CCSS. The Consortium also deploys essential resources that are embedded in the test to ensure accurate assessment of all students, including students with disabilities, English language learners, and low- and high-performing students. Smarter Balanced implemented a system that features

- assessment of CCSS using secure adaptive summative assessments that incorporate items that are deliberatively designed to measure specific content. The assessments include a variety of item types including technology-enhanced items, items that require constructed response and performance tasks.
- interim assessments that incorporate items that are developed according to the same processes as the items incorporated in the summative assessment. The interim assessments are not secure and provide more flexible administration options to assist educators in determining what students know and can do in relation to the CCSS.
- a digital library that includes research-supported tools, processes, and practices developed by experts that support the formative process teachers can use to improve their professional practices.
- open sourced technology that members can use to delivery assessments and report results to educators.
- cross-member state communications to inform stakeholders about Smarter Balanced activities and to ensure a common focus on the goal of college- and career-readiness for all students.

The innovative and efficient use of technology serves as a central feature of this balanced assessment system. Some central notions concerning technology use are that

1. the Smarter Balanced system uses computer adaptive testing to increase the precision and efficiency of the summative tests,
2. the expanded use of technology enables the development of innovative and realistic item types that measure student achievement across a wide performance continuum providing opportunities for educator and administrator professional development and local capacity building, and
3. through the use of an interoperable electronic platform and leveraging of cross-member state resources, Smarter Balanced delivers assessments and produces standardized reports that are cost effective, timely, and useful for a range of audiences in tracking and analyzing student progress toward college- and career-readiness at the individual student, student subgroup, classroom, school, district, and state levels.

In summary, the Smarter Balanced learning and assessment system is grounded in a sound theory of action. This system promotes research-supported classroom practice and incorporates a balanced set of technology-enabled tools, innovative assessments, and classroom support materials intended to work coherently to facilitate teaching and learning.

## Technical Report Approach

The intent of this report is to provide comprehensive and detailed evidence in support of the validity of Smarter Balanced assessment program. This report focuses on summative tests and will be supplemented with information about interim tests. Information about the overall system is provided to provide context. At the outset, it should be recognized that demonstration of validity is an ongoing process. Validity evidence provided here is from the first year of operational testing, referencing initial pilot and field test phases as needed.

Because the consortium is comprised of members who contract separately for test delivery and scoring and have varied practices for test administration, some evidence of validity comes from the member, not from the Consortium. This will be noted throughout this report. In some cases (e.g., the Online Test Administration Manual), the consortium provides a customizable template or a guidance document, that allows for members to document their test administration practices.

To inform the Consortium, the Standards for Educational and Psychological Testing (American Educational Research Association [AERA], American Psychological Association [APA], \& National Council on Measurement in Education [NCME], 2014), hereafter referred to as the Standards, was used as the foundation for developing the necessary validity evidence. Also referenced is the U.S. Department of Education (U.S. DOE) Peer Review of State Assessment Systems Non-Regulatory Guidance for States for Meeting Requirements of the Elementary and Secondary Education Act of 1965 (2015), which stipulates the requirements for assessment programs to receive federal approval under current ESEA legislation. With respect to Smarter Balanced, this information is
necessary for understanding the degree to which the Consortium is meeting its goals, and in some cases, what further tasks remain to improve the system as it evolves operationally.

## Peer Review Guidelines and Established Standards

Among the principles underlying the Smarter Balanced theory of action is adherence "to established professional standards" (Smarter Balanced, 2010, p. 33). In addition to adhering to the AERA et al. (2014) Standards, the Consortium will also meet selected requirements of the U.S. DOE peer review process for ESEA assessments. There is a great deal of overlap between the AERA et al. (2014) Standards and the U.S. DOE Peer Review Guidance. However, the Guidance stipulates many important requirements. In particular, to meet these requirements the validity evidence and the ongoing research agenda should include

- evidence concerning the purpose of an assessment system and studies that support the validity of using results from the assessment system based on their stated purpose and use,
- strong correlations of test and item scores, with relevant measures of academic achievement and weak correlations with irrelevant characteristics, such as demographics (i.e., convergent and discriminant validity),
- documentation of the definitions for cut scores and the rationale and procedures for establishing them,
- evidence concerning the precision of the cut scores and consistency of student classification,
- evidence of sufficient levels of reliability for the overall population and for each targeted subpopulation,
- evidence of content alignment over time through quality control reviews,
- evidence of comprehensive alignment and measurement of the full range of content standards, Depth of Knowledge, and cognitive complexity,
- evidence that the assessment plan and test specifications describe how all content standards are assessed and how the domain is sampled that lead to valid inferences about student performance on the standards, both individually and aggregated,
- scores that reflect the full range of achievement standards,
- documentation that describes how the assessments consist of a coherent system across grades and subjects including studies establishing vertical scales, and
- identification of how assessments provide information on the progress of students.

These characteristics of high-quality assessment systems were given consideration in the development of the Smarter Balanced Assessment System to provide evidence that assessments meet these high standards. The Theory of Action and primary purposes and goals of Smarter Balanced are briefly described below.

## Overview and Background of the Smarter Balanced Theory of Action

The Smarter Balanced Assessment Consortium supports the development and implementation of learning and assessment systems to reshape education in member states in order to improve student outcomes. Through expanded use of technology and targeted professional development, the Consortium's Theory of Action calls for the integration of learning and assessment systems, leading to more informed decision-making and higher-quality instruction and ultimately increasing the number of students who are well prepared for college and careers.

The ultimate goal of Smarter Balanced is to ensure that all students leave high school prepared for postsecondary success in college or a career through increased student learning and improved teaching. This approach suggests that enhanced learning will result from high-quality assessments that support ongoing improvements in instruction and learning. A quality assessment system strategically "balances" summative, interim, and formative components (Darling-Hammond \& Pecheone, 2010). An assessment system must provide valid measurement across the full range of performance on common academic content, including assessment of deep disciplinary understanding and higher-order thinking skills increasingly demanded by a knowledge-based economy.

## Six Principles of Smarter Balanced Underlying the Theory of Action

The Smarter Balanced assessment is guided by a set of six principles shared by systems in highachieving nations and a number of high-achieving states in the U.S.

1. Assessments are grounded in a thoughtful, standards-based curriculum and managed as part of an integrated system of standards, curriculum, assessment, instruction, and teacher development. Curriculum and assessments are organized around a well-defined set of learning progressions along multiple dimensions within subject areas. Formative and interim/benchmark assessments and associated support tools are conceptualized in tandem with summative assessments; all of them are linked to the CCSS and supported by a unified technology platform.
2. Assessments produce evidence of student performance on challenging tasks that evaluate the CCSS. Instruction and assessments seek to teach and evaluate knowledge and skills that generalize and can transfer to higher education and multiple work domains. These assessments emphasize deep knowledge of core concepts and ideas within and across the disciplines-along with analysis, synthesis, problem solving, communication, and critical thinking-thereby requiring a focus on complex performances as well as on specific concepts, facts, and skills.
3. Teachers are integrally involved in the development and scoring of assessments. While many assessment components are efficiently scored with computer assistance, teachers must also be involved in the formative and summative assessment systems so that they understand and can teach in a manner that is consistent with the full intent of the standards while becoming more skilled in their own classroom assessment practices.
4. The development and implementation of the assessment system is a state-led effort with a transparent and inclusive governance structure. Assessments are structured to improve
teaching and learning. Assessments as, of, and for learning are designed to develop understanding of learning standards, what constitutes high-quality work, to what degree is growth occurring, and what is needed for further student learning.
5. Assessment, reporting, and accountability systems provide useful information on multiple measures that is educative for all Stakeholders. Reporting of assessment results is timely and meaningful-offering specific information about areas of performance so that teachers can follow up with targeted instruction, students can better target their own efforts, and administrators and policymakers can fully understand what students know and can do-in order to guide curriculum and professional development decisions.
6. Design and implementation strategies adhere to established professional standards. The development of an integrated, balanced assessment system is an enormous undertaking, requiring commitment to established quality standards in order for the system to be credible, fair, and technically sound. Smarter Balanced continues to be committed to developing an assessment system that meets critical elements required by US DOE Peer Review, relying heavily on the Standards as its core resource for quality design.

Figure 1. Overview of Smarter Balanced Theory of Action

The primary rationale of the Smarter Balanced assessments is that these aspects can interact to improve the intended student outcomes (i.e., college- and career-readiness). Connection among these assessment components is presented in Figure 1.

## Purposes for the Smarter Balanced Assessment System

The Smarter Balanced purpose statements refer to three categories: (a) summative assessments, (b) interim assessments, and (c) formative assessment resources.

The purposes of the Smarter Balanced summative assessments are to provide valid, reliable, and fair information about

- students' ELA/literacy and mathematics achievement with respect those CCSS measured by the ELA/literacy and mathematics summative assessments in grades 3 to 8 and high school,
- whether students prior to grade 11 have demonstrated sufficient academic proficiency in ELA/literacy and mathematics to be on track for achieving college readiness,
- whether grade 11 students have sufficient academic proficiency in ELA/literacy and mathematics to be ready to take credit-bearing, transferable college courses after completing their high school coursework,
- students' annual progress toward college- and career-readiness in ELA/literacy and mathematics,
- how instruction can be improved at the classroom, school, district, and state levels,
- students' ELA/literacy and mathematics proficiencies for federal accountability purposes and potentially for state and local accountability systems, and
- students' achievement in ELA/literacy and mathematics that is equitable for all students and subgroups of students.

This report provides technical information about the summative assessments, but the purposes of interim assessments and formative resources are given here to provide context for summative assessments as a component of the assessment system.

The purposes of the Smarter Balanced interim assessments are to provide valid, reliable, and fair information about

- student progress toward mastery of the skills in ELA/literacy and mathematics measured by the summative assessment,
- student performance at the Claim or cluster of Assessment Targets so teachers and administrators can track student progress throughout the year and adjust instruction accordingly,
- individual and group (e.g., school, district) performance at the Claim level in ELA/literacy and mathematics to determine whether teaching and learning are on target,
- teacher-moderated scoring of performance events as a professional development vehicle to enhance teacher capacity to evaluate student work aligned to the standards, and
- student progress toward the mastery of skills measured in ELA/literacy and mathematics across all students and subgroups.

The purposes of the Smarter Balanced formative assessment resources are to provide measurement tools and resources to

- improve teaching and learning,
- provide resources to teachers to help them monitor their students' progress throughout the school year,
- illustrate how teachers and other educators can use assessment data to engage students in monitoring their own learning,
- help teachers and other educators align instruction, curricula, and assessments,
- assist teachers and other educators in using the summative and interim assessments to improve instruction at the individual and classroom levels, and
- offer professional development and resources for how to use assessment information to improve teacher decision-making in the classroom.

## Overview of Report Chapters:

Chapters in the Technical Report follow elements in the 2014 Standards:

| CH: | Chapter title |
| :--- | :--- |
| 1 | Validity |
| 2 | Reliability/Precision and Errors of Measurement |
| 3 | Test Fairness |
| 4 | Test Design |
| 5 | Scores, Scales, Norms |
| 6 | Test Administration |
| 7 | Reporting and Interpretation |

Brief synopses of the chapters contained are given below in order to direct further review. At the suggestion of our members, we have written practical descriptions of the purpose of evidence in each chapter to provide context for teachers, parents and other stakeholders.

## Chapter 1: Validity

In a sense, all of the information in this Technical Report provides validity evidence. This chapter provides information about test purposes and the overall approach to showing how scores are appropriate for those purposes.

Description: This chapter provides information in answer to the following questions. For what purposes was the summative assessment designed to be used? What evidence shows that test scores are appropriate for these uses? What are the intended test score interpretations for specific uses?

Content: Chapter 1 provides the statement of test purposes; valid score uses and interpretations; outline of validity evidence in the rest of the report.

## Chapter 2: Reliability/Precision and Errors of Measurement

Information about simulated and operational performance of the test in delivering scores is provided in this chapter. The degree of accuracy and precision of scores contributes to evidence about appropriate test score interpretation and use. Decisions must be made with full knowledge of measurement error and reliability.

Description: How do we know that scores are accurate? What kind of instructional decisions does precision support? Are scores accurate enough to evaluate change over time in growth models? How do we know they are stable and have the same meaning for all students?

Content: Chapter 2 presents simulated and operational conditional standard errors of measurement, marginal and fixed-form reliability, test information curve; observed decision consistency and accuracy; simulation results for bias and theta recovery.

## Chapter 3: Test Fairness

Test fairness concerns whether score interpretations are valid for all relevant subgroups that minimizes construct irrelevant variance. The evidence for test fairness can be logical (e.g., bias review of items) or statistical in nature (e.g., differential item functioning) and includes availability of resources that increase participation and improve assessment of skills.

Description: How do we know that the test is fair to all students? How was fairness guaranteed in developing test questions and tasks? How is the test administered so that each student can demonstrate their skills?

Content: Chapter 3 presents the Smarter Balanced Conceptual Framework for Usability, Accessibility, and Accommodations, bias and sensitivity reviews conducted during item and task development and differential item functioning (DIF) analysis.

## Chapter 4: Test Design

This chapter provides information pertaining to the content validity of the Smarter Balanced assessment system. It describes the how tasks and items are structured to achieve domain coverage. For Smarter Balanced tests, test design includes the relationship of claims and targets to the underlying CCSS and how adaptive and performance components work together. The full test
design also encompasses the delivery algorithm and the method of scoring the test. This chapter includes a description of item pool and task development supporting test design.

Description: What's on the test? Is it consistent with stated test purposes? Does each student get a set of questions that addresses content fully? How does the test assure that each student gets a test with an appropriate level of difficulty?

Content: Chapter 4 provides evidence that the CCSS address skills required for college and career readiness. It also describes test structure (claims, targets) and its relationship to the CCSS, item and task development and alignment studies. Chapter 4 also has information about the operational blueprints, adaptive algorithm, test scoring method and application and pool analysis.

## Chapter: 5 Scores, Scales and Norms

This chapter describes the steps to adopting a psychometric model and how Smarter Balanced scales were constructed. It also covers the achievement level setting process and resulting cut scores. Normative information about the Consortium population is also included.

Description: What do the scores mean? How can we know that descriptions of achievement levels match criteria for those levels? Are criteria stable so teachers can work toward a fixed goal? How does a student's score compare to expected criteria; to those of his or her peers?

Content: Chapter 5 summarizes how scales were established in pilot and field test stages. It describes how cut scores were developed from foundational achievement level descriptors that delineated progress toward career and college readiness. It provides logit-to-scale transformations. Normative information, including means, percentiles and achievement level distribution is displayed.

## Chapter 6: Test Administration

Part of test validity rests on the assumption that assessments are given in a standard manner. Because Smarter Balanced tests are given on such a large scale, in different policy and operational contexts, the Consortium provides a common administration template that members customize for specific use. This chapter includes analysis of field test items presented during test administration.

Description: What are conditions for test administration to assure that every student was afforded the same chance for success? How was the test administered to allow for accessibility for all students? Was the test administration secure? Do test records show that the test was administered as intended? Were field tested items successful?

Content: Chapter 6 describes the customizable Smarter Balanced Online Test Administration Manual. It presents operational item exposure rates and blueprint fidelity. Embedded field test results, including item scoring processes and inter-rater reliability of field tested items are shown.

## Chapter 7: Reporting and Interpretation

Examples of Smarter Balanced reports are shown here, along with an explanation of report elements. This chapter discusses intended uses of report information.

Description: What information do Smarter Balance reports contain? What do scores mean? How can the reports best be used by teachers and parents?

Content: Chapter 7 provides examples of the Smarter Balanced suite of reports and interpretive information.

## Contributors to the Accessibility Accommodations Framework.

In February 2012, the Smarter Balanced Assessment Consortium Accessibility and Accommodations Work Group began work on developing the Accessibility and Accommodations Framework. The primary goal of this effort was to develop uniform accessibility and accommodation policies and guidelines that will be adopted and used by all Smarter Balanced members. Recognizing the diversity in policies and practices that currently exist across member states, the legal issues that must be addressed by the policies, the mixed research findings regarding many accommodation practices, and the differences in opinion regarding accommodation policies, the work group undertook an iterative process designed to gather input from a large and diverse audience. This effort began by contracting with Measured Progress and its partners, who included:

- Members of the Measured Progress Innovation Lab who conducted work in accessibility in digital environments, developed the Accessible Test Design model, and were leaders in developing the Accessible Portable Item Protocol (APIP) Standard,
- Experts at Educational Testing Service who have conducted a variety of studies on test accommodations and accessibility for students with disabilities and for students who are English language learners, and who have developed industry-recognized guidelines for accessibility in the context of assessment,
- Experts at the George Washington University Center for Equity and Excellence in Education, who are nationally recognized experts in accessible assessment for students who are English language learners and who have worked with several states to develop policies on test accommodations for students who are English language learners, and
- Experts affiliated with the National Center on Educational Outcomes who have conducted extensive reviews of state test accommodation policies, worked with the Assessing Special Education Students (ASES) work group of the Council of Chief State School Officers (CCSSO) to develop test accommodation policies, and closely monitored research on test accommodations.

In addition to these partners, an expert panel was formed composed of the following members:

- Jamal Abedi assessment of English language learners, UC Davis/CRESST,
- Martha Thurlow assessment of students with disabilities, University of Minnesota/NCEO,
- Sheryl Lazarus test accommodations for students with disabilities, University of Minnesota/NCEO,
- Stephanie Cawthon accommodations for students who communicate in American Sign Language, University of Texas at Austin,
- Richard Jackson accommodations for students with visual impairments, Boston College,
- Rebecca Kopriva assessment of students who are English language learners, Wisconsin Center for Education Research, and
- Stephen Sireci validity of test accommodations, University of Massachusetts Amherst/CEA.

## Other Acknowledgments.

This technical report leveraged the Smarter Balanced Comprehensive Research Agenda by Stephen G. Sireci (2012) as the primary validity framework and sources of evidence. Input was provided on critical aspects of the program and this report by the Smarter Balanced Technical Advisory Committee.

## Chapter 1: Validity

## Introduction

Validity refers to the degree to which each interpretation or use of a test score is supported by the accumulated evidence (American Educational Research Association [AERA], American Psychological Association [APA], \& National Council on Measurement in Education [NCME], 2014; ETS, 2002). It constitutes the central notion underlying the development, administration, and scoring of a test and the uses and interpretations of test scores. Validation is the process of accumulating evidence to support each proposed score interpretation or use. This validation process does not rely on a single study or gathering one type of evidence. Rather, validation involves multiple investigations and different kinds of supporting evidence (AERA, APA, \& NCME, 2014; Cronbach, 1971; ETS, 2002; Kane, 2006). It begins with test design and is implicit throughout the assessment process, which includes development, field-testing and analyses of items, test scaling and linking, scoring, and reporting. This chapter provides an evaluative framework for the validation of the Smarter Balanced summative assessment. It points the reader to supporting evidence in other parts of the technical report and other sources that seek to demonstrate that the Smarter Balanced Assessment System adheres to guidelines for fair and high quality assessment.

The validity argument begins with a statement of summative assessment intended purposes, followed by the evidentiary framework supporting the validity argument. Evidence is organized around the principles in the AERA, APA, and NCME's Standards for Educational and Psychological Testing (2014), hereafter referred to as the Standards, and the Smarter Balanced Assessment Consortium: Comprehensive Research Agenda (Sireci, 2012).

The Standards are considered to be "the most authoritative statement of professional consensus regarding the development and evaluation of educational and psychological tests" (Linn, 2006, p. 27) currently available. The 2014 Standards differ from earlier versions in the emphasis given to the increased prominence of technology in testing, including computer adaptive testing (CAT). Dr. Sireci based his research agenda work on the Standards and his work in operational interpretation of validity argumentation (Sireci, 2013).

## Purposes of the Smarter Balanced System for Summative Assessments

To derive the statements of purpose listed below, panels consisting of Smarter Balanced leadership, including the Executive Director, Smarter Balanced staff, Dr. Stephen Sireci and key personnel from Consortium states were convened.

The purposes of the Smarter Balanced summative assessments are to provide valid, reliable, and fair information about:
7. Students' ELA/literacy and mathematics achievement with respect to those CCSS measured by the ELA/literacy and mathematics summative assessments in grades 3 to 8 and high school.
8. Whether students prior to grade 11 have demonstrated sufficient academic proficiency in ELA/literacy and mathematics to be on track for achieving college readiness.
9. Whether grade 11 students have sufficient academic proficiency in ELA/literacy and mathematics to be ready to take credit-bearing, transferable college courses after completing their high school coursework.
10. Students' annual progress toward college and career readiness in ELA/literacy and mathematics.
11. How instruction can be improved at the classroom, school, district, and state levels.
12. Students' ELA/literacy and mathematics proficiencies for federal accountability purposes and potentially for state and local accountability systems.
13. Students' achievement in ELA/literacy and mathematics that is equitable for all students and subgroups of students.

## Summary of Validity Argument

The crux of the argument presented here is that the technical quality of the summative assessments supports these purposes. The Common Core State Standards (CCSS), which have been adopted by Smarter Balanced members, are widely recognized content standards for college and career readiness in high school grades, and for being on track for college and career readiness in lower grades (Conley et al 2011). Content specifications and test blueprints show that the Smarter Balanced summative assessments essentially cover the breadth and depth of assessable standards. Content experts developed expanded item types that allow response processes that reveal skills and knowledge, Most of each content area test is delivered adaptively so that blueprint requirements are met, but scores are more accurate and student experience is enhanced. Summative test scores are suitable for use in a variety of member accountability systems. Claim-level sub-score reports indicate directions for gaining further instructional information through the interim system or classroom observation.

The consortium chose its psychometric model after investigating a variety of models and establishing a clear structural relationship across grades. The vertical scale was constructed to provide measurement across grades, facilitating estimates of progress toward career and college readiness. The appropriateness of Smarter Balanced performance standards as predictors of college and career readiness in grade 11 and of being on-track for readiness in grades three through eight was established by an extended achievement level setting process. The process began with authoring achievement level descriptors and continued through a rigorous process of setting achievement criteria. These processes involved participants from member higher education systems to ensure that readiness criteria represented skills needed for success in first year college courses.

This is a high-level view of the validity argument. A detailed description of evidence appears below.

## Validity Framework for Summative Assessments

The Standards describe a process of validation that consists of developing a sufficiently convincing argument, based on empirical evidence, that the interpretations and actions based on test scores are sound. Kane $(1992,2006)$ characterized this process as a validity argument, which is consistent with the validation process described by the 2014 Standards.

A sound validity argument integrates various strands of evidence into a coherent account of the degree to which existing evidence and theory support the intended interpretation of test scores for specific uses. . . Ultimately, the validity of an intended interpretation of test scores relies on all the available evidence relevant to the technical quality of a testing system (AERA et al., 2014, p. 21-22).

The validity framework corresponds to validity evidence sources described in the Standards (AERA et al. 2014, pp. 26-31). They are also the organizing principles for the Smarter Balanced research framework document (Sireci, 2012). These five sources of validity evidence consist of:

1. Evidence Based on Test Content
2. Evidence Based on Response Processes
3. Evidence Based on Internal Structure
4. Evidence Based on Relations to Other Variables
5. Evidence for Validity and Consequences of Testing.

This Technical Report provides part of the evidence for this framework. As many observers have noted, validity is an ongoing process with continuous addition of evidence from a variety of contributors. This report summarizes development and performance of the instrument itself, addressing test content, response processes and internal structure. Other elements come from supplemental research projects or third party studies.

As the Standards note, "validation is the joint responsibility of the test developer and the test user." (AERA, et. al. 2014, p, 13). The Consortium does not control aspects of test administration and use. It is comprised of members who deliver the test, score operational items and provide reports. Members use Smarter Balanced test scores in their own accountability models. In this report, guidelines for administration and use are documented. For complete validity evidence, member documentation on specific test administration procedures, reporting, and use should be consulted.

This report does not provide evidence related to the consequences of testing. Ultimate use of test scores is determined by consortium members. Each member decides the purpose and interpretation of scores and each has crafted its own system of reporting and accountability. The Consortium provides information about test content and technical quality, but does not interfere in member use of scores. The consortium does not endorse or critique member uses.

In many cases, validity evidence will come from an outside auditor, such as the federal peer reviewer process or from an external study. Table 1.1 shows the components of validity covered in this report, other sources, and future studies.

TABLE 1.1 SOURCES OF VALIDITY ELEMENTS

|  | Source of Validity Evidence for Summative Assessments |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Purpose | Test Content | Internal Structure | Relations to Other Variables | Response Processes |
| 1. Report achievement with respect to the CCSS as measured by the ELA/literacy and mathematics summative assessments in grades 3 to 8 and high school. | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| 2. Assess whether students prior to grade 11 have demonstrated sufficient academic proficiency in ELA/literacy and mathematics to be on track for achieving college readiness. | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| 3. Assess whether grade 11 students have sufficient academic proficiency in ELA/literacy and mathematics to be ready to take credit-bearing, transferable college courses after completing their high school coursework. | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| 4. Measure students' annual progress toward college and career readiness in ELA/literacy and mathematics. | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| 5. Inform how instruction can be improved at the classroom, school, district, and state levels. | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |

## Essential Validity Evidence Derived from the Standards

The Standards (AERA et al. 2014, p.22) also present a set of essential validity elements consistent with evidence typically reported for large-scale educational assessment programs. The essential validity elements present a traditional synopsis of validity evidence, which form the basis for the evidence demonstrated for the Smarter Balanced initial operational administration.

The Standards describe these essential validity elements as
A. evidence of careful test construction;
B. adequate score reliability;
C. appropriate test administration and scoring;
D. accurate score scaling, equating, and standard setting; and
E. attention to fairness, equitable participation and access.

Table 1.6 presents a brief description of the essential validity evidence. Many of these essential validity elements fall under the validity evidence based on test content (e.g., careful test construction) and internal structure (adequate score reliability, scaling, equating). The sources of evidence listed in Table 1.1 will reemerge when considering the five specific validity elements, which represent the full validity framework. This overlap underscores the fundamental nature of these elements for supporting the use of Smarter Balanced assessments for their intended purposes. Table 1.6 is followed by a brief description of the potential types of evidence associated with each essential element.

TABLE 1.6 SYnopsis of ESSENTIAL VALIDITY EVIDENCE DERIVED FROM STANDARDS (AERA ET AL., 2014, P. 22)

| Essential Element | Chapter | Type of Associated Validation Evidence |
| :--- | :--- | :--- |
| Careful Test <br> Construction | 4. Test Design | Description of test development steps, including construct definition <br> (test specifications and blueprints), item writing and review, item data <br> analysis, alignment studies |
| Adequate <br> Measurement Precision <br> (Reliability) | 2. Reliability, <br> Precision \& Error | Analysis of test information, conditional standard errors of <br> measurement, decision accuracy and consistency, and reliability <br> estimates. |
| Appropriate Test <br> Administration | 6. Test <br> Administration | Test administration procedures, including protocols for test irregularities; <br> availability and assignment of test accommodations. Test, item and data <br> security. |
| Appropriate Item <br> Scoring | 6. Test <br> Administration | Scoring procedures, rater agreement analyses. |
| Accurate Scaling and | 5. Scales, <br> Scores, and <br> Norms | Documentation of test design, IRT model choice, scaling and equating <br> procedures, IRT residuals, validating vertical scaling assumptions. |

| Essential Element | Chapter | Type of Associated Validation Evidence |
| :--- | :--- | :--- |
| Appropriate Standard <br> Setting | 5. Scales, <br> Scores, and <br> Norms | Comprehensive standard-setting documentation provided, including <br> procedural, internal, and external validity evidence for all achievement- <br> level standards. |
| Attention to Fairness, <br> Equitable Participation <br> and Access | 3. Test Fairness | Accommodation policy guidelines, implementation of accommodations, <br> sensitivity review, DIF analyses, analyses of accommodated tests; <br> analysis of participation rates, availability of translations. |

## The 2014 Standards' Five Primary Sources of Validity Evidence

The five sources of validity evidence serve as organizing principles and represent a comprehensive framework for evaluating validity for Smarter Balanced. These sources of validity evidence are intended to emphasize different aspects of validity. However, since validity is a unitary concept, they do not constitute distinct types of validity. These five sources of validity evidence consist of (1) test content, (2) response processes, (3) internal structure, (4) relations to other variables, and (5) consequences of testing. They are briefly described below:
6. Validity evidence based on test content refers to traditional forms of content validity evidence, such as the rating of test specifications and test items (Crocker, Miller, \& Franks, 1989; Sireci, 1998), as well as "alignment" methods for educational tests that evaluate the interactions between curriculum frameworks, testing, and instruction (Rothman, Slattery, Vranek, \& Resnick, 2002; Bhola, Impara \& Buckendahl, 2003; Martone \& Sireci, 2009). The degree to which (a) the Smarter Balanced test specifications captured the Common Core State Standards and (b) the items adequately represent the domains delineated in the test specifications, were demonstrated in the alignment studies. The major assumption here is that the knowledge, skills, and abilities measured by the Smarter Balanced assessments are consistent with the ones specified in the Common Core State Standards. Administration and scoring can be considered as aspects of content-based evidence. With computer adaptive testing, an extra dimension of test content is to ensure that the tests administered to students conform to the test blueprint.
7. Validity evidence based on response processes refers to "evidence concerning the fit between the construct and the detailed nature of performance or response actually engaged in by examinees" (AERA et al., 1999 p. 12). This evidence might include documentation of such activities as

- interviewing students concerning their responses to test items (i.e., speak alouds);
- systematic observations of test response behavior;
- evaluation of the criteria used by judges when scoring performance tasks, analysis of student item-response-time data, features scored by automated algorithms; and
- evaluation of the reasoning processes students employ when solving test items (Emberetson, 1983; Messick, 1989; Mislevy, 2009).

This type of evidence was used to confirm that the Smarter Balanced assessments are measuring the cognitive skills that are intended to be the objects of measurement and that students are using these targeted skills to respond to the items.
8. Validity evidence based on internal structure refers to statistical analyses of item and score subdomains to investigate the primary and secondary (if any) dimensions measured by an assessment. Procedures for gathering such evidence include factor analysis or multidimensional IRT scaling (both exploratory and confirmatory). With a vertical scale, a consistent primary dimension or construct shift across the levels of the test should be maintained. Internal structure evidence also evaluates the "strength" or "salience" of the major dimensions underlying an assessment using indices of measurement precision such as test reliability, decision accuracy and consistency, generalizability coefficients, conditional and unconditional standard errors of measurement, and test information functions. In addition, analysis of item functioning using Item Response Theory (IRT) and differential item functioning (DIF) fall under the internal structure category. For Smarter Balanced, a dimensionality study was conducted in the Pilot Test to determine the factor structure of the assessments and the types of scales developed as well as the associated IRT models used to calibrate them.
9. Evidence based on relations to other variables refers to traditional forms of criterion-related validity evidence such as concurrent and predictive validity, as well as more comprehensive investigations of the relationships among test scores and other variables such as multitraitmultimethod studies (Campbell \& Fiske, 1959). These external variables can be used to evaluate hypothesized relationships between test scores and other measures of student achievement (e.g., test scores and teacher grades), the degree to which different tests actually measure different skills and the utility of test scores for predicting specific criteria (e.g., college grades). This type of evidence is essential for supporting the validity of certain inferences based on scores from the Smarter Balanced assessments for certifying college and career readiness, which is one of the primary test purposes. A subset of students who took NAEP and PISA items also took Smarter Balanced items and performance tasks. A summary of the resulting item performance for NAEP, PISA, and all Smarter Balanced items was conducted, the results are discussed in Chapter 5. Usually, association with other assessment results requires a data set with a common set of either test items or examinees. The Consortium has not yet acquired a data set from its members so a study of this type is out of the scope of this manual. However, other organizations have studied the association between Smarter Balanced tests and other tests of similar constructs. These include linking Smarter Balanced to California's current high school graduation tests (ETS, 2015) and linking course grades to Smarter Balanced cut scores in Washington (OSPI, 2016)
10. Finally, evidence based on consequences of testing refers to the evaluation of the intended and unintended consequences associated with a testing program. Examples of evidence based on testing consequences include investigations of adverse impact, evaluation of the effects of testing on instruction, and evaluation of the effects of testing on issues such as
high school dropout rates. With respect to educational tests, the Standards stress the importance of evaluating test consequences. For example, they state,

When educational testing programs are mandated . . . the ways in which test results are intended to be used should be clearly described. It is the responsibility of those who mandate the use of tests to monitor their impact and to identify and minimize potential negative consequences.
Consequences resulting from the use of the test, both intended and unintended, should also be examined by the test user (AERA et al., 2014, p. 145).

Investigations of testing consequences relevant to the Smarter Balanced goals include analyses of students' opportunity to learn with regard to the Common Core State Standards, and analyses of changes in textbooks and instructional approaches. Unintended consequences, such as changes in instruction, diminished morale among teachers and students, increased pressure on students leading to increased dropout rates, or the pursuit of college majors and careers that are less challenging, can be evaluated. These studies are beyond the scope of this report.

## Conclusion for Summative Test Validity Results

Validation is an ongoing, essentially perpetual endeavor in which additional evidence can be provided but one can never absolutely "assert" an assessment is perfectly valid (Haertel, 1999). This is particularly true for the many purposes typically placed on tests. Program requirements are often subject to change and the populations assessed change over time. Nonetheless, at some point decisions must be made regarding whether sufficient evidence exists to justify the use of a test for a particular purpose. A review of the purpose statements and the available validity evidence determines the degree to which the principles outlined here have been realized. Most of this report focuses on describing some of the essential validity elements required for necessary evidence. The essential validity elements presented here constitute critical evidence "relevant to the technical quality of a testing system" (AERA et al., 2014, p. 22).

## Chapter 2: Reliability, Precision and Errors of Measurement

## Introduction

This chapter addresses the technical quality of operational test functioning with regard to precision and reliability. Part of the test validity argument is that scores must be consistent and precise enough to be useful for intended purposes. If scores are to be meaningful, tests should deliver the same results under repeated administrations or for students of the same ability. In addition, the range of certainty around the score should be small enough to support educational decisions. The concepts of reliability and precision are examined through analysis of measurement error in simulated and operational conditions. Reliability in physical instruments is checked by repeated measurement. For example, reliability of scales are verified by seeing that the scale always gives the same weight for the same object. For assessments, it isn't possible to give the same test more than once to the same individual without altering the object of measurement. Consequently, reliability is inferred from test properties, including test length and the information provided by item parameters. Items with difficulty parameters appropriate to examinee ability, and those with higher discrimination values provide more information. Longer tests give more information because they provide more certainty about student functioning. Smarter Balanced uses an adaptive model because adaptive tests are customized to each student, thereby yielding lower error and greater reliability than fixed form tests of the same length. Standard errors of measurement, the inverse of the square root of information, are related to reliability in that they represent the standard deviation of repeated test scores.

## Simulations Studies for 2014-15 Operational Summative Tests

For Smarter Balanced tests with an adaptive component, test reliability is estimated through simulations conducted using the operational summative item pool. For fixed form tests, reliability and error are calculated using the number of items and their psychometric properties relative to the population.

The National Center for Research on Evaluation, Standards, \& Student Testing (CRESST) conducted simulation studies for the 2014-15 tests using packaged pools with its own simulation engine. This serves as a baseline for service providers that deliver Smarter Balanced assessments. American Institutes for Research also conducted a simulation study of the CAT portion of the summative tests (AIR, 2014b).

Results from CRESST's simulation are presented here. For each grade and content area, true ability (theta) values for 1,000 simulees were created using the population distribution of the sample used in standard setting.

TABLE 2.1 POPULATION PARAMETERS USED TO GENERATE ABILITY DISTRIBUTIONS FOR SIMULATED TEST ADMINISTRATIONS

| Grade | ELA/Literacy |  | Mathematics |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Mean | SD | Mean | SD |
| 3 | -1.240 | 1.06 | -1.285 | 0.97 |
| 4 | -0.748 | 1.11 | -0.708 | 1.00 |
| 5 | -0.310 | 1.10 | -0.345 | 1.08 |
| 6 | -0.055 | 1.11 | -0.100 | 1.19 |
| 7 | 0.114 | 1.13 | 0.010 | 1.33 |
| 8 | 0.382 | 1.13 | 0.176 | 1.42 |
| 11 | 0.529 | 1.19 | 0.506 | 1.52 |

Using the adaptive algorithm (Cohen \& Albright, 2014) with the operational pools, test events were created for the simulated examinees. Estimated ability ( $\hat{\boldsymbol{\theta}}$ ) was calculated from the simulated tests using maximum likelihood estimation (MLE) as described in the Smarter Balanced test scoring specifications (AIR, 2014a). In the 2014-15 administration, the test scoring algorithm resolved extreme scores by using the highest and lowest obtainable scale scores (HOSS and LOSS) derived during 2014 achievement level setting. Scores above HOSS or below LOSS are assigned HOSS and LOSS values. This provides a limit to the score range, which is desired in public reporting.

Table 2.2 HOSS/LOSS VALUES IN LOGIT UNITS AND PERCENTAGES OF AFFECTED SIMULATION RESULTS

| Grade | Obtainable Score Range |  | Percentage of Affected <br> Scores |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | LOSS | HOSS | LOSS | HOSS |
| English Language Arts/Literacy |  |  |  |  |
| 3 | -4.59 | 1.34 | 0.7 | 1.1 |

Statistics for simulations computed include the following:

- Bias: the statistical bias of the estimated theta parameter. This is a test of the assumption that error is randomly distributed around true ability. It is a measure of whether scores systematically underestimate or overestimate ability
- Mean squared error (MSE): This is a measure of the magnitude of difference between true and estimated theta.
- Significance of the bias: indicator of the statistical significance of bias
- Average standard error of the estimated theta: This is the average of the simulated standard error of measurement. It is the marginal reliability for the simulated population.
- Standard error of theta at the 5th, 25th, 75th, and 95 th percentiles
- Percentage of students' estimated theta falling outside the $95 \%$ and $99 \%$ confidence intervals.

Computational details of each statistic are provided below.

$$
\begin{align*}
& \text { bias }=N^{-1} \sum_{i=1}^{N}\left(\theta_{i}-\hat{\theta}_{i}\right)  \tag{1}\\
& M S E=N^{-1} \sum_{i=1}^{N}\left(\theta_{i}-\hat{\theta}_{i}\right)^{2} \tag{2}
\end{align*}
$$

where $\theta_{i}$ is the true score and $\hat{\theta}_{i}$ is the estimated (observed) score.
Variance of the bias:

$$
\begin{equation*}
\operatorname{var}(\text { bias })=\frac{1}{N(N-1)} \sum_{i=1}^{N}\left(\theta_{i}-\overline{\hat{\theta}}_{i}\right)^{2} \tag{3}
\end{equation*}
$$

where, $\overline{\hat{\theta}}_{i}$ is an average of the estimated theta.
Significance of the bias is then tested as:

$$
\begin{equation*}
z=\text { bias } / \sqrt{\operatorname{var}(\text { bias })} \tag{4}
\end{equation*}
$$

A $p$-value for the significance of the bias is reported from this $z$ test.
The average standard error is computed as:

$$
\begin{equation*}
\operatorname{mean}(s e)=\sqrt{N^{-1} \sum_{i=1}^{N} s e_{i}^{2}} \tag{5}
\end{equation*}
$$

where $\operatorname{se}\left(\hat{\theta}_{i}\right)^{2}$ is the standard error of the estimated $\theta$ for individual $i$.
To determine the number of students falling outside the $95 \%$ and $99 \%$ confidence interval coverage, a t -test is performed as follows:

$$
\begin{equation*}
t=\frac{\theta_{i}-\hat{\theta}_{i}}{\operatorname{se}\left(\hat{\theta}_{i}\right)} \tag{6}
\end{equation*}
$$

where $\hat{\theta}$ is the ability estimate for individual $i$, and $\theta$ is the true score for individual $i$. The percentage of students' estimated theta falling outside the coverage is determined by comparing the absolute value of the $t$-statistic to a critical value of 1.96 for the $95 \%$ coverage and to 2.58 for the $99 \%$ coverage.

| 11 | 0.20 | 0.05 | 0.00 | 1.20 | 9.1 | 3.6 |

Bias in overall scores is both small and insignificant. Claim scores do include some systematic bias. This is likely caused by application of HOSS and LOSS values. In the simulation, the HOSS was applied more often than the LOSS which caused some asymmetry in estimates.

Table 2.5 and Table 2.6 below show marginal reliability (mean $\rho$ ) and precision overall and by reported claim. As expected, overall estimated reliability coefficients are high and in the acceptable range for a large scale, high stakes test. Reliability estimates at the claim level are lower, and error is higher. Claims with smaller numbers of items and fewer points from the adaptive section of the test exhibit the lowest reliability. (These are claims 2 and 4 in English Language Arts/literacy (ELA/literacy) and claims $2 / 4$ and 3 in mathematics.) This shows the importance of incorporating error in claim level reports.

Table 2.7 shows average error by decile of the true thetas, which were generated based on the achievement-level-setting population. One of the advantages of adaptive tests is that error can be controlled for all levels of theta. Table 2.7 shows that error at the high end of the test is consistent with overall error and only slightly above error for the mean population. There is some increase in error at the first and second deciles, caused by the relative difficulty of the pools noted in Chapter 4.

## Tests for Special Populations

The Consortium developed assessments in Braille for mathematics and ELA/literacy. Assessments in mathematics were also developed for translated glossaries, stacked Spanish translations and American Sign Language. American Sign Language pools were also developed for Claim 3 (Listening) in English Language Arts. The same set of items was used for all translated glossary pools in Arabic, Cantonese, Mandarin, Spanish, Tagalog, Korean, Punjabi, Russian, Ukrainian and Vietnamese. These tests followed the blueprints and were identical to the standard test except for the item pool. Students eligible for these test versions were given the appropriate pool. Details of simulations for Braille and stacked Spanish tests can be found in the full simulation report (National Center for Research on Evaluation, Standards, \& Student Testing [CRESST], 2015a). Details of simulations for the American Sign Language and translated glossary pools can be found in a separate report (CRESST, 2016).

## Item exposure

Table 2.8 shows the distribution of items across simulated test events. Exposure rates represent the number of test events in which items appeared. For example, in Grade 3 ELA/literacy, $97 \%$ of the items in the pool appeared in 0 to 20 percent of test events. Most items show a desired moderate exposure, and there are relatively few unused items. There are two items in grade 5 ELA/literacy and one item in grade 11 mathematics that were delivered to almost all students. In these cases, the pool contained only one item in a required element. This will be remedied in future tests as new items are added to the pools.

Table 2.8 Percent of items by exposure rate

| Grade | Total <br> Items | English Language Arts/Literacy |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $0 \%-20 \%$ | $21 \%-40 \%$ | $41 \%-60 \%$ | $61 \%-80 \%$ | $81 \%-100 \%$ |  |  |

## Blueprint fidelity

For target and Depth of Knowledge (DOK) constraints, the simulated ELA CAT test events met blueprint specifications with the exceptions noted in Table 2.9: nine Grade 4 tests did not have the minimum number of items at DOK level 2 ; one Grade 5 test did not have the minimum number of Claim 1, Target 9 items; one Grade 6 test did not have the minimum number of Claim 1, Target 2 items; and 44 Grade 6 tests did not have the minimum number of items with DOK level 2 or greater. In mathematics, all CAT portions met the blueprint requirements for targets and DOK.

Table 2.9 CAT tests with blueprint Deviations

| Grade | Subject | Blueprint Specification | Blueprint Requirement |  |  | Percentage of Tests |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Pg. \# | Min | Max | Below Min. <br> by 2 or more | Below Min. by 1 | Above Max. by 1 | Above Max. by 2 or more | Total |
| 4 | ELA | Claim 1, DOK=2 | 4 | 6 | 6 | 0 | 0.9 | 0 | 0 | 0.9 |
| 5 | ELA | Claim 1 (Informational), Target 9: Central Ideas | 4 | 1 | 2 | 0 | 0.1 | 0 | 0 | 0.1 |
| 6 | ELA | Claim 1 (Literary), Target 2: Central Ideas | 7 | 1 | 1 | 0 | 0.1 | 0 | 0 | 0.1 |
| 6 | ELA | Claim 2, DOK $\geq 2$ | 7 | 5 | - | 0.1 | 4.2 | 0 | 0 | 4.3 |

As shown in Table 2.10, not all performance tasks conform to the blueprint specifications. In ELA/literacy, some have fewer research items; in mathematics some have fewer than six items. The remaining PT items still allow claim level reporting when combined with CAT items. There was a decision on the part of Smarter Balanced leadership to accept these performance tasks as operational. The Consortium will adjust the blueprint requirements to match operational PTs.

Table 2.10 PT Tests with blueprint deviations

| Grade | Subject | Blueprint Specification | Blueprint Requirement |  |  | Percentage of Tests |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Observed Reliability

Observed reliability is derived from standard errors of measurement computed from the test form each student took. The method of standard error calculation for both total and score reporting category scores, as described in Smarter Balanced Scoring Specifications for 2014-15 (AIR, 2014a), is displayed below:

The standard error (SE) for student $i$ is:

$$
S E\left(\theta_{i}\right)=\frac{1}{\sqrt{I\left(\theta_{i}\right)}}
$$

where $I\left(\theta_{i}\right)$ is the test information for student $i$, calculated as:

$$
I\left(\theta_{i}\right)=\sum_{j=1}^{I} D^{2} a_{j}^{2}\left(\frac{\sum_{l=1}^{m_{j}} l^{2} \operatorname{Exp}\left(\sum_{k=1}^{l} D a_{j}\left(\theta_{i}-b_{j k}\right)\right)}{1+\sum_{l=1}^{m_{j}} \operatorname{Exp}\left(\sum_{k=1}^{l} D a_{j}\left(\theta_{i}-b_{j k}\right)\right)}-\left(\frac{\sum_{l=1}^{m_{j}} l \operatorname{Exp}\left(\sum_{k=1}^{l} D a_{j}\left(\theta_{i}-b_{j k}\right)\right)}{1+\sum_{l=1}^{m_{j}} \operatorname{Exp}\left(\sum_{k=1}^{l} D a_{j}\left(\theta_{i}-b_{j k}\right)\right)}\right)^{2}\right)
$$

where $m_{j}$ is the maximum possible score point (starting from 0 ) for the $j$ th item, $D$ is the scale factor, 1.7. Values of $a_{j}$ and $b_{j k}$ are item parameters for item $j$ and score level $k$.

SE is calculated based only on the answered items. The upper bound of SE is set to 2.5 on theta metric. Any value larger than 2.5 is truncated at 2.5 on theta metric.

Standard errors reported here have been transformed to the reporting scale metric. This transformation is:

$$
S E_{v s}=a * S E_{\theta_{i}}
$$

where $S E_{\theta}$ is the standard error of the ability estimate on the $\theta$ scale and $a$ is the slope of the scaling constants that take $\theta$ to the reporting scale.

Because the set of items administered to each student in a Smarter Balanced adaptive test is virtually unique, standard error is estimated for each test event. Reliability for each total score and claim/reporting category score is derived from the SE using the following relationship:

$$
S E\left(\theta_{i}\right)=s_{x} \sqrt{1-r}
$$

Where $s_{x}$ is the standard deviation of the score and $r$ is reliability for that particular test event.

$$
r=1-\left(\frac{S E}{s_{x}}\right)^{2}
$$

Reliability for a test instrument as a whole is called marginal reliability and is estimated as one minus the ratio of mean error variance to observed score variance. Marginal reliability for the data submitted by members ${ }^{1}$ using the general test pools are given in Table 2.11 and Table 2.12. Because claim scores are based on fewer items, they have lower reliability than total scores.

Table 2.11 ELA summative scale marginal reliability estimates

| Grade | N | Total <br> score | Claim 1 | Claim 2 | Claim 3 | Claim 4 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 3 | 710,836 | .920 | .739 | .768 | .544 | .608 |
| 4 | 674,936 | .918 | .737 | .769 | .559 | .624 |
| 5 | 698,426 | .922 | .754 | .790 | .517 | .640 |
| 6 | 689,274 | .908 | .690 | .777 | .477 | .587 |
| 7 | 677,287 | .915 | .730 | .778 | .480 | .607 |
| 8 | 679,863 | .915 | .739 | .766 | .508 | .610 |
| 11 | 610,761 | .918 | .737 | .770 | .528 | .637 |

Table 2.12 MAth summative scale score marginal reliability estimates

| Grade | N | Total <br> Score | Claim 1 | Claim 2/4 | Claim 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 3 | 717,519 | .940 | .884 | .654 | .601 |
| 4 | 702,093 | .941 | .889 | .601 | .698 |
| 5 | 699,713 | .929 | .875 | .561 | .596 |
| 6 | 689,045 | .925 | .867 | .567 | .616 |
| 7 | 681,387 | .909 | .848 | .537 | .486 |
| 8 | 681,197 | .918 | .850 | .539 | .662 |
| 11 | 557,386 | .893 | .817 | .496 | .541 |

Table 2.13 and Table 2.14 show that reliability varies by overall score levels. All students take the same number of items, but the information delivered by the items differs. The most information, and hence lower error and higher reliability, is found where the pool has the most items. Smarter Balanced pools are difficult relative to the population. Students with lower scores (deciles 1 and 2) have lower reliability than those with higher scores (deciles 8 and 9.)

Because of the differences by score level, demographic groups with lower average scores tend to have lower reliability than the population as a whole. Table 2.15 to Table 2.18 show marginal reliability by demographic group.

## Paper/Pencil Test Reliability

Smarter Balanced supports fixed form paper/pencil tests for use in schools that lack computer capacity or to address potential religious concerns associated with using technology for assessments. The paper/pencil tests are on the Smarter Balanced scale with parameters estimated using a set of anchors from online administrations (CRESST, 2015b)². The number of paper pencil tests administered is presented in the Chapter 5 Addendum.

## Classification Accuracy

Classification accuracy is a measure of how accurately test scores or sub-scores place students into reporting category levels. The likelihood of inaccurate placement depends on the amount of error associated with scores, especially those nearest cut points. For this report, classification accuracy was calculated in the following manner${ }^{3}$. For each examinee, analysts constructed a normal distribution with means equal to the scale score estimate and standard deviation equal to the standard error of measurement as a plausible true score distribution. For each student, the proportion of that normal distribution that fell within each level was calculated.

[^1]The figure below illustrates the approach for one examinee in Grade 11 mathematics. In this example, the examinee's overall scale score is 2606 , with a standard error of measurement of 31 points. Accordingly, a normal distribution with mean of 2606 and standard deviation of 31 is used to approximate a plausible distribution for this examinee's true score, based on the observed test performance. From this distribution, we obtain the probability that the true score falls within each level.

Figure 2.1 Illustrative example of a normal distribution used to calculate classification accuracy

The table below shows the results for 10 examinees from Grade 11 Mathematics (the examinee illustrated above is Student \#6).

TABLE 2.21 ILLUSTRATIVE EXAMPLE CLASSIFICATION ACCURACY CALCULATION RESULTS

| Student | SS | SEM | Level | probability that true score is in level |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ |

Within the groups of students assigned to a particular level (Level 1, 2, 3 or 4 for the overall score; Below Standard, At/Near Standard, and Above Standard for the claim scores), we obtained the sums of the proportions over examinees. This gives us estimates of the number of students whose true score falls within a particular level, for each assigned performance/achievement level. These sums can then be expressed as a proportion of the total sample.

TABLE 2.22 EXAMPLE ESTIMATED DISTRIBUTION OF TRUE ACHIEVEMENT LEVELS FOR EACH ASSIGNED ACHIEVEMENT LEVEL

| Assigned Level | N | P | Expected Frequency |  |  |  | Expected Proportion |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | 1 | 2 | 3 | 4 | 1 | 2 | 3 | 4 |
| Overall |  |  |  |  |  |  |  |  |  |  |
| Level 1 | 251,896 | . 451 | 225,454 | 26,172 | 263 | 8 | . 404 | . 047 | . 000 | . 000 |
| Level 2 | 141,256 | . 253 | 21,800 | 100,364 | 19,080 | 11 | . 039 | . 180 | . 034 | . 000 |
| Level 3 | 104,125 | . 186 | 161 | 14223 | 81089 | 8652 | . 000 | . 025 | . 145 | . 015 |
| Level 4 | 61,276 | . 110 | 47 | 29 | 6452 | 54748 | . 000 | . 000 | . 012 | . 098 |
| Claim 3 |  |  |  |  |  |  |  |  |  |  |
| Below Standard | 167810 | . 300 | 143536 | 18323 | 4961 | 990 | . 257 | . 033 | . 009 | . 002 |
| At/Near Standard | 309550 | . 554 | 93364 | 102133 | 89696 | 24357 | . 167 | . 183 | . 161 | . 044 |
| Above Standard | 81193 | . 145 | 94 | 1214 | 18949 | 60936 | . 000 | . 002 | . 034 | . 109 |

Taking the table of expected proportions, two correct classification rates are then defined. First, a correct classification rate is provided for each assigned level (excluding the "At/Near Standard" classification for claims). This is the proportion of students whose true classification matches the assigned level, among the subset of students with that assigned level. In the table below, the calculations are illustrated.

TABLE 2.23 IlLUSTRATIVE EXAMPLE OF CORRECT CLASSIFICATION RATES

| Assigned Level | P | Expected Proportion |  |  |  | Correct Classification |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 1 | 2 | 3 | 4 | by level | overall |
| Overall |  |  |  |  |  |  |  |
| Level 1 | . 451 | . 404 | . 047 | . 000 | . 000 | .404/.451=.895 | $(.404+.180+.145+.098) / 1.000=.827$ |
| Level 2 | . 253 | . 039 | . 180 | . 034 | . 000 | .180/.253=.711 |  |
| Level 3 | . 186 | . 000 | . 025 | . 145 | . 015 | .145/.186=.779 |  |
| Level 4 | . 110 | . 000 | . 000 | . 012 | . 098 | .098/.110=.893 |  |
| Claim 3 |  |  |  |  |  |  |  |
| Below <br> Standard | . 300 | . 257 | . 033 | . 009 | . 002 | $(.257+.033) / .300=.965$ | $(.257+.033+.034+.109) /(.300+.145)=.971$ |
| At/Near Standard | . 554 | . 167 | . 183 | . 161 | . 044 | NA |  |
| Above Standard | . 145 | . 000 | . 002 | . 034 | . 109 | $(.034+.109) / .145=.984$ |  |

The overall classification rate is the sum of the proportions of students whose true score level matches the assigned level, divided by the total proportion of students assigned to a level. This denominator is 1 for the overall score (i.e., all students are assigned to a level). For the claim scores, the denominator is one minus the proportion whose level is deemed "At/Near Standard." Note that for the claim scores, the "Below" classification is correct when the true score falls within in levels 1 or 2; the "Above" classification is correct when the true score falls within in levels 3 or 4.

In the tables below, accuracy is highest for claim scores, since there are fewer categories to match and categorization is based on SEM, assuring that off-diagonal placements are rare. For overall scores, high and low categories have higher accuracy than middle categories since there is only one adjacent cell. In general, classification accuracy is moderate to high.

English Language Arts/Literacy Classification Accuracy

Notes: (a) Correct classification rate by level is the expected proportion of students among those assigned to a particular level who are correctly assigned; (b) overall correct classification rate is the expected proportion of students among those assigned to any level (excluding the "At/Near" classification) who are correctly assigned.

## Standard Errors of Measurement

The reliability of reported test scores can be characterized by the standard errors associated with the students' test scores. The standard errors of measurement (SEM), the inverse of the square root of information, are related to reliability in that they represent the standard deviation of repeated test scores.

The conditional standard errors of measurement (CSEM) express the degree of measurement error in scale score units and are conditioned on the ability of the student. When using a computeradaptive assessment, the CSEM will vary for the same scale score; therefore, it is necessary to report averages.

Table 2.38 presents the overall SEM and the CSEM by scale score decile for ELA/literacy and mathematics. This table shows that the CSEM is relatively similar between deciles 2 and 10. The CSEM tends to be higher at the first decile.

Table 2.38 Overall SEM and Conditional Standard Errors of Measurement (CSEM) by Decile, ela/literacy and Mathematics 2014-2015 Administration

| Content Area Grade | Overall <br> SEM | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 3 | 24.7 | 32.9 | 26.2 | 24.4 | 23.6 | 23.0 | 22.6 | 22.4 | 22.3 | 22.7 | 24.7 |
|  | 4 | 26.4 | 33.0 | 27.4 | 26.1 | 25.4 | 24.9 | 24.6 | 24.5 | 24.5 | 24.7 | 27.3 |
| ELA/Literacy | 6 | 26.0 | 32.0 | 25.7 | 24.7 | 24.3 | 24.4 | 24.6 | 24.6 | 24.7 | 25.2 | 28.0 |
|  | 7 | 27.6 | 36.0 | 28.6 | 26.7 | 26.0 | 25.7 | 25.6 | 25.7 | 25.8 | 26.1 | 28.1 |
|  | 8 | 27.5 | 33.7 | 29.0 | 27.2 | 26.5 | 26.1 | 25.7 | 25.5 | 25.5 | 26.1 | 29.3 |

## Online Platform Effects

Test are delivered through a variety of configurations based on equipment available to students. Smarter Balanced makes every effort to ensure comparability in assessment results regardless of the device available to students. For online assessments, Smarter Balanced is currently able to detect whether students used a device with a mouse (desktop/laptop) or used a tablet. The analysis of the 2014-15 operational data for these different modes is described below.

CRESST analyzed operational assessment data ${ }^{4}$ to evaluate platform effects for students who used either a desktop/laptop or tablet. For this analysis, calibrations of the items within each online platform (desktop/laptop or tablet) were compared against previous estimates (i.e., the item parameter values used in operational scoring). These calibrations were performed separately by platform.

As an initial step, CRESST screened all multiple choice items in the pool (for a given grade level and subject) as potential anchors, as it was expected that these items would be the least impacted by platform. Items were tested for invariance across the platforms so long as there were at least 500 observed scores for the particular platform. If the number of observed item scores exceeded 10,000, we randomly sampled 10,000 cases.

[^2]Likelihood ratio tests provided a formal evaluation of the null hypothesis that platform-specific item parameters were exactly equal to the previously specified values. However, this test tends to be quite sensitive (rejecting the null hypothesis for the majority of items). Accordingly, the weighted absolute area between expected score curves (wABC; see, e.g., Stucky, Edelen, \& Chandra, 2015) was used as our primary criterion for judging the severity of differential item functioning across platforms.

Multiple choice items with $w A B C>0.10$ were rejected as anchor items, while those with wABC $\leq 0.10$ were retained. In all calibrations, the latent variable mean and variance were freely estimated (because the group of individuals administered a particular item cannot be assumed to be representative of the population, due to adaptive item selection). Results of this screening of candidate anchors are summarized in Tables 3 and 4. The vast majority of multiple choice items tested were retained as anchors.

After screening the multiple choice items to obtain a final set of anchors, CRESST proceeded with the calibration of all non-anchor items (i.e., the multiple choice items rejected as anchors, as well as items of any other type) for which a minimum of 500 scores were available. Due to differences in platform use, more items could be tested (calibrated) for desktop/laptop than for tablet. Results of the analyses are summarized in Tables 3 (ELA/literacy) and 4 (Mathematics) below. Not all items in the pools could be evaluated. However, among those that were tested, the vast majority of items had very small wABC values, suggesting minimal differences in item functioning across the platforms. Specifically, across grades, subjects, and platforms, less than $1 \%$ of items showed wABC>0.20, except for grade 11 ELA/literacy tablets (for which $3 \%$ of the items had wABC>0.20). These results suggest that items functioned similarly across platforms.

Notes: "LRT p < .01" indicates the number ( N ) and proportion $(\mathrm{P})$ of items with p-values < . 01. The likelihood ratio tests and expected score curves (the basis of the weighted area between the curves) were based on comparisons of models in which an item's parameters are freely estimated and a second, nested model in which the item's parameters were fixed to their prior estimates (the scoring parameters). Items with $w A B C>0.10$ or for which calibrations did not converge were rejected as anchors for analysis of platform differences.

## Chapter 3: Test Fairness

## Introduction

The Smarter Balanced Assessment Consortium (Smarter Balanced) has designed the assessment system to provide all eligible students with a fair assessment and equitable opportunity to participate in the Smarter Balanced Assessment. Ensuring test fairness is a fundamental part of validity, starting with test design, and is an important feature built into each step of the test development process, such as item writing, test administration, and scoring. The 2014 Standards for Educational and Psychological Testing (AERA, APA, \& NCME, 2014, p. 49) state, "The term fairness has no single technical meaning, and is used in many ways in public discourse." It also suggests that fairness to all individuals in the intended population is an overriding and fundamental validity concern. As indicated in the Standards for Educational and Psychological Testing (2014, p. 63), "The central idea of fairness in testing is to identify and remove construct-irrelevant barriers to maximal performance for any examinee."

The Smarter Balanced system is designed to provide a valid, reliable, and fair measure of student achievement based on the Common Core State Standards ${ }^{5}$ (CCSS). The validity and fairness of the measures of student achievement are influenced by a multitude of factors; central among them are:

- a clear definition of the construct-the knowledge, skills, and abilities-that are intended to be measured,
- the development of items and tasks that are explicitly designed to assess the construct that is the target of measurement,
- delivery of items and tasks that enable students to demonstrate their achievement of the construct
- capture and scoring of responses to those items and tasks.

Smarter Balanced uses several processes to address reliability, validity, and fairness. The construct is defined in the CCSS which were developed during a state-led effort that was launched in 2009 by state leaders, including governors and state commissioners of education from 48 states, two territories and the District of Columbia, through their membership in the National Governors Association Center for Best Practices (NGA Center) and the Council of Chief State School Officers (CCSSO). The CCSS is a set of high-quality academic standards in mathematics and English language arts/literacy (ELA/literacy) that outline what a student should know and be able to do at the end of each grade. The standards were created to ensure that all students graduate from high school with the skills and knowledge necessary for post-secondary success. The CCSS have been adopted by all Consortium members. The Smarter Balanced Content Specifications for the Summative Assessment of the CCSS for English Language Arts/Literacy and the Smarter Balanced Content Specifications for the Summative Assessment of the CCSS for Mathematics, developed by Smarter Balanced (2015a; 2015b), define the knowledge, skills, and abilities to be assessed and their relationship to the CCSS. In doing so, these documents describe the major constructsidentified as "Claims"-within ELA/literacy and mathematics for which evidence of student achievement is gathered and which forms the basis for reporting student performance. Each claim is

[^3]accompanied by a set of assessment targets that provide more detail about the range of content and Depth of Knowledge levels. The targets serve as the building blocks of test blueprints. Much of the evidence presented in this chapter pertains to fairness to students during the testing process and design elements and procedures that serve to minimize measurement bias (i.e., DIF). Fairness in item and test design processes and the design of accessibility supports (i.e., universal tools, designated supports and accommodations) in content development are also addressed.

## Definitions for Validity, Bias, Sensitivity, and Fairness.

Some key concepts for the ensuing discussion concern validity, bias, and fairness and are described as follows.

Validity. Validity is the extent to which the inferences and actions made based on test scores are appropriate and backed by evidence (Messick, 1989). It constitutes the central notion underlying the development, administration and scoring of a test, as well as the uses and interpretations of test scores. Validation is the process of accumulating evidence to support each proposed score interpretation or use. Evidence in support of validity is extensively discussed in Chapter 2.

Attention to bias and sensitivity in test development. According to the Standards for Educational and Psychological Testing, bias is "construct underrepresentation or construct-irrelevant components of tests scores that differentially affect the performance of different groups of test takers and consequently the reliability/precision and validity of interpretations and uses of their test scores." (AERA, APA, \& NCME, 2014, p. 216). "Sensitivity" refers to an awareness of the need to avoid explicit bias in assessment. In common usage, reviews of tests for bias and sensitivity help ensure that test items and stimuli are fair for various groups of test takers, (AERA, APA, \& NCME, 2014, p. 64).

The goal of fairness in assessment is to assure that test materials are as free as possible from unnecessary barriers to the success of diverse groups of students. Smarter Balanced developed Bias and Sensitivity Guidelines (ETS, 2012) to help ensure that the assessments are fair for all groups of test takers, despite differences in characteristics including, but not limited to, disability status, ethnic group, gender, regional background, native language, race, religion, sexual orientation, and socioeconomic status. Unnecessary barriers can be reduced by following some fundamental rules:

- measuring only knowledge or skills that are relevant to the intended construct
- not angering, offending, upsetting, or otherwise distracting test takers, and
- treating all groups of people with appropriate respect in test materials.

These rules help ensure that the test content is fair for test takers as well as acceptable to the many stakeholders and constituent groups within Smarter Balanced member organizations. The more typical view is that bias and sensitivity guidelines apply primarily to the review of test items. However, fairness must be considered in all phases of test development and use. Smarter Balanced strongly relied on the Bias and Sensitivity Guidelines in the development of the Smarter Balanced assessments, particularly in item writing and review. Items must comply with the Bias and Sensitivity Guidelines in order to be included in the Smarter Balanced assessments. Use of the Guidelines will help the Smarter Balanced assessments comply with Chapter 3, Standard 3.2 of the Standards for Educational and Psychological Testing. Standard 3.2 states that "Test developers are responsible for
developing tests that measure the intended construct and for minimizing the potential for tests" being affected by construct-irrelevant characteristics such as linguistic, communicative, cognitive, cultural, physical or other characteristics." (AERA, APA, \& NCME, 2014, p. 64).

Smarter Balanced assessments were developed using the principles of evidence-centered design (ECD). ECD requires a chain of evidence-based reasoning that links test performance to the Claims made about test takers. Fair assessments are essential to the implementation of ECD. If test items are not fair, then the evidence they provide means different things for different groups of students. Under those circumstances, the Claims cannot be equally supported for all test takers, which is a threat to validity. As part of the validation process, all items are reviewed for bias and sensitivity using the Bias and Sensitivity Guidelines prior to being presented to students. This helps ensure that item responses reflect only knowledge of the intended content domain, are free of offensive or distracting material and portray all groups in a respectful manner. When the guidelines are followed, item responses provide evidence that supports assessment claims.

## The Smarter Balanced Accessibility and Accommodations Framework

Smarter Balanced has built a framework of accessibility for all students, including English Language Learners (ELLs), students with disabilities, and ELLs with disabilities, but not limited to those groups. Three resources-the Smarter Balanced Item Specifications (2015c), the Smarter Balanced Usability, Accessibility, and Accommodations Guidelines (2014b), and the Smarter Balanced Bias and Sensitivity Guidelines (ETS, 2012)-are used to guide the development of items and tasks to ensure that they accurately measure the targeted constructs. Recognizing the diverse characteristics and needs of students who participate in the Smarter Balanced assessments, the states worked together through the Smarter Balanced Test Administration and Student Access Work Group to develop an Accessibility and Accommodations Framework (2014a) that guided the Consortium as it worked to reach agreement on the specific universal tools, designated supports, and accommodations available for the assessments. This work also incorporated research and practical lessons learned through Universal Design, accessibility tools, and accommodations (Thompson, Johnstone, \& Thurlow, 2002).

In the process of developing its next-generation assessments to measure students' knowledge and skills as they progress toward college and career readiness, Smarter Balanced recognized that the validity of assessment results depends on each student having appropriate universal tools, designated supports, and/or accommodations when needed, based on the constructs being measured by the assessment. The Smarter Balanced Assessment System uses technology intended to deliver assessments that meet the needs of individual students. Online/electronic delivery of the assessments helps ensure that students are administered a test individualized to meet their needs while still measuring the same construct. During the administration of tests, items and tasks are delivered using a variety of accessibility resources and accommodations that can be administered to students automatically based on their individual profiles. Accessibility resources include but are not limited to foreground and background color flexibility, tactile presentation of content (e.g., braille), and translated presentation of assessment content in signed form and selected spoken languages.

One of Smarter Balanced's main goals was to adopt a common set of accessibility resources and accommodations. As a starting point, Smarter Balanced surveyed all members to determine their
past practices. From these data, Smarter Balanced used a deliberative analysis strategy as described in Accommodations for English Language Learners and Students with Disabilities: A Research-Based Decision Algorithm (Abedi \& Ewers, 2013) to determine which accessibility resources should be made available during the assessment and whether access to these resources should be moderated by an adult. As a result, some accessibility resources that states traditionally had identified as accommodations, were instead embedded in the test or otherwise incorporated into the Smarter Balanced assessments as universal tools. Other resources were not incorporated into the assessment because access to these resources were not grounded in research. The final list of accessibility resources and the recommended use of the resources can be found in the Usability Accessibility and Accommodations Guidelines (2014b, pp. 6-20).

A fundamental goal was to design an assessment that is accessible for all students, regardless of English language proficiency, disability, or other individual circumstances. The three components of the Accessibility and Accommodations Framework are designed to meet that need. The intent was to ensure that the following steps were achieved for Smarter Balanced.

- Design and develop items and tasks to ensure that all students have access to the items and tasks designed to measure the targeted constructs. In addition, deliver items, tasks, and the collection of student responses in a way that maximizes validity for each student.
- Adopt the conceptual model embodied in the Accessibility and Accommodations Framework that describes accessibility resources of digitally delivered items/tasks and acknowledges the need for some adult-monitored accommodations. The model also characterizes accessibility resources as a continuum from those available to all students ranging to ones that are implemented under adult supervision available only to those students with a documented need.
- Implement the use of an individualized and systematic needs profile for students, or Individual Student Assessment Accessibility Profile (ISAAP), that promotes the provision of appropriate access and tools for each student. Smarter created an ISAAP process that helps education teams systematically select the most appropriate accessibility resources for each student and the ISAAP tool, which helps teams note the accessibility resources chosen.

The conceptual framework that serves as the basis underlying the usability, accessibility, and accommodations is shown in Figure 3.1. This figure portrays several aspects of the Smarter Balanced assessment resources-universal tools (available for all students), designated supports (available when indicated by an adult or team), and accommodations as documented in an Individualized Education Program (IEP) or 504 plan. It also displays the additive and sequentially inclusive nature of these three aspects. Universal tools are available to all students, including those receiving designated supports and those receiving accommodations. Designated supports are available only to students who have been identified as needing these resources (as well as those students for whom the need is documented). Accommodations are available only to those students with documentation of the need through a formal plan (e.g., IEP, 504). Those students also may access designated supports and universal tools.

A universal tool or a designated support may also be an accommodation, depending on the content target and grade. This approach is consistent with the emphasis that Smarter Balanced has placed
on the validity of assessment results coupled with access. Universal tools, designated supports, and accommodations are all intended to yield valid scores. Use of universal tools, designated supports, and accommodations result in scores that count toward participation in statewide assessments. Also shown in Figure 3.1 are the universal tools, designated supports, and accommodations for each category of accessibility resources. There are both embedded and non-embedded versions of the universal tools, designated supports, or accommodations depending on whether they are provided as digitally delivered components of the test administration or separate from test delivery.

## Embedded

American Sign Language, Braille, Closed Captioning, Streamline, Text-tospeech

Non-embedded
Abacus, Alternate Response Options, Calculator, Multiplication Table, Print on Demand, Read Aloud, Scribe Speech-to-te

## Meeting the Needs of Traditionally Underrepresented Populations.

The policy decision was to make accessibility resources available to all students based on need rather than eligibility status or student subgroup categorical designation. This reflects a belief among Consortium states that unnecessarily restricting access to accessibility resources threatens the validity of the assessment results and places students under undue stress and frustration. Additionally, accommodations are available for students who qualify for them. The Consortium utilizes a needs-based approach to providing accessibility resources. A description as to how this benefits ELLs, students with disabilities, and ELLs with disabilities is presented here.

## How the Framework Meets Needs of Students Who Are ELLs.

Students who are ELLs have needs that are unique from those students with disabilities, including language-related disabilities. The needs of ELLs are not the result of a language-related disability, but instead are specific to the student's current level of English language proficiency. The needs of students who are ELLs are diverse and are influenced by the interaction of several factors, including their current level of English language proficiency, their prior exposure to academic content and language in their native language, the languages to which they are exposed outside of school, the length of time they have participated in the U.S. education system, and the language(s) in which academic content is presented in the classroom. Given the unique background and needs of each student, the conceptual framework is designed to focus on students as individuals and to provide several accessibility resources that can be combined in a variety of ways. Some of these digital tools, such as using a highlighter to highlight key information and an audio presentation of test navigation features, are available to all students, including those at various stages of English language development. Other tools, such as the audio presentation of items and glossary definitions in English, may also be assigned to any student, including those at various stages of English language development. Still other tools, such as embedded glossaries that present translations of construct irrelevant terms, are intended for those students whose prior language experiences would allow them to benefit from translations into another spoken language. Collectively, the conceptual framework for usability, accessibility, and accommodations embraces a variety of accessibility resources that have been designed to meet the needs of students at various stages in their English language development.

## How the Framework Meets Needs of Students with Disabilities.

Federal law requires that students with disabilities who have a documented need receive accommodations that address those needs, and that they participate in assessments. The intent of the law is to ensure that all students have appropriate access to instructional materials and are held to the same high standards. When students are assessed, the law ensures that students receive appropriate accommodations during testing so they can appropriately demonstrate what they know and can do so that their achievement is measured accurately.

The Accessibility and Accommodations Framework addresses the needs of students with disabilities in three ways. First, it provides for the use of digital test items that are purposefully designed to contain multiple forms of the item, each developed to address a specific access need. By allowing the delivery of a given access form of an item to be tailored based on each student's access need,
the Framework fulfills the intent of federal accommodation legislation. Embedding universal accessibility digital tools, however, addresses only a portion of the access needs required by many students with disabilities. Second, by embedding accessibility resources in the digital test delivery system, additional access needs are met. This approach fulfills the intent of the law for many, but not all, students with disabilities, by allowing the accessibility resources to be activated for students based on their needs. Third, by allowing for a wide variety of digital and locally provided accommodations (including physical arrangements), the Framework addresses a spectrum of accessibility resources appropriate for math and ELA assessment. Collectively, the Framework adheres to federal regulations by allowing a combination of universal design principles, universal tools, designated supports and accommodations to be embedded in a digital delivery system and through local administration assigned and provided based on individual student needs. Therefore, a student who is both an ELL and a student with a disability benefits from the system, because they may be eligible to have access to resources from any of the 3 categories as necessary to create an assessment tailored to their individual need.

## The Individual Student Assessment Accessibility Profile (ISAAP).

Typical practice frequently required schools and educators to document, a priori, the need for specific student accommodations and then to document the use of those accommodations after the assessment. For example, most programs require schools to document a student's need for a largeprint version of a test for delivery to the school. Following the test administration, the school documented (often by bubbling in information on an answer sheet) which of the accommodations, if any, a given student received, whether the student actually used the large-print form, and whether any other accommodations, such as extended time, were provided. Traditionally, many programs have focused only on those students who have received accommodations and thus may consider an accommodation report as documenting accessibility needs. The documentation of need and use establishes a student's accessibility needs for assessment.

For most students, universal digital tools will be available by default in the Smarter Balanced test delivery system and need not be documented. These tools can be deactivated if they create an unnecessary distraction for the student. Other embedded accessibility resources that are available for any student needing them must be documented prior to assessment. To capture specific student accessibility needs, the Smarter Balanced Assessment System has established an individual student assessment accessibility profile (ISAAP). The ISAAP Tool is designed to facilitate selection of the universal tools, designated supports and accommodations that match student access needs for the Smarter Balanced assessments, as supported by the Smarter Balanced Usability, Accessibility, and Accommodations Guidelines. The ISAAP Tool6 should be used in conjunction with the Smarter Balanced Usability, Accessibility and Accommodations Guidelines and state regulations and policies related to assessment accessibility as a part of the ISAAP process. For students requiring one or more accessibility resource, schools will be able to document this need prior to test administration. Furthermore, the ISAAP can include information about universal tools that may need to be eliminated for a given student. By documenting need prior to test administration, a digital delivery system will be

[^4]able to activate the specified options when the student logs in to an assessment. In this way, the profile permits school-level personnel to focus on each individual student, documenting the accessibility resources required for valid assessment of that student in a way that is efficient to manage.

The conceptual framework shown in Figure 3.1 provides a structure that assists in identifying which accessibility resources should be made available for each student. In addition, the conceptual framework is designed to differentiate between universal tools available to all students and accessibility resources that must be assigned before the administration of the assessment. Consistent with recommendations from Shafer and Rivera (2011), Thurlow, Quenemoen, and Lazarus (2011), Fedorchak (2012), and Russell (2011), Smarter Balanced is encouraging schoollevel personnel to use a team approach to make decisions concerning each student's ISAAP. Gaining input from individuals with multiple perspectives, including the student, will likely result in appropriate decisions about the assignment of accessibility resources. Consistent with these recommendations avoidance of selecting too many accessibility resources for a student. The use of too many unneeded accessibility resources can decrease student performance.

The team approach encouraged by Smarter Balanced does not require the formation of a new decision-making team, and the structure of teams can vary widely depending on the background and needs of a student. A locally convened student support team can potentially create the ISAAP. For most students who do not require accessibility tools or accommodations, an initial decision by a teacher may be confirmed by a second person (potentially the student). In contrast, for a student who is an English language learner and has been identified with one or more disabilities, the IEP team should include the English language development specialist who works with the student, along with other required IEP team members and the student, as appropriate. The composition of teams is not being defined by Smarter Balanced; it is under the control of each school and is subject to state and Federal requirements.

## Usability, Accessibility, and Accommodations Guidelines: Intended Audience and Recommended Applications.

Smarter Balanced has developed Usability, Accessibility, and Accommodations Guidelines (UAAG) that are intended for school-level personnel and decision-making teams, particularly Individualized Education Program (IEP) teams, as they prepare for and implement the Smarter Balanced assessment. The UAAG provide information for classroom teachers, English development educators, special education teachers, and related services personnel to use in selecting and administering universal tools, designated supports, and accommodations for those students who need them. The UAAG are also intended for assessment staff and administrators who oversee the decisions that are made in instruction and assessment. The Smarter Balanced UAAG emphasize an individualized approach to the implementation of assessment practices for those students who have diverse needs and participate in large-scale content assessments. This document focuses on universal tools, designated supports, and accommodations for the Smarter Balanced content assessments of ELA/literacy and mathematics. At the same time, it supports important instructional decisions about accessibility for students who participate in the Smarter Balanced assessments. It recognizes the critical connection between accessibility in instruction and accessibility during assessment. The UAAG are also incorporated into the Smarter Balanced Test Administration Manuals.

According to the UAAG (2014b, p. 2), all eligible students (including students with disabilities, ELLs, and ELLs with disabilities) should participate in the assessments. In addition, the performance of all students who take the assessment are measured with the same criteria. Specifically, all students enrolled in grades 3 to 8 and 11 are required to participate in the Smarter Balanced mathematics assessment except students with the most significant cognitive disabilities who meet the criteria for the mathematics alternate assessment based on alternate achievement standards (approximately $1 \%$ or less of the student population).
All students enrolled in grades 3 to 8 and 11 are required to participate in the Smarter Balanced English language/literacy assessment except:

- students with the most significant cognitive disabilities who meet the criteria for the English language/literacy alternate assessment based on alternate achievement standards (approximately $1 \%$ or fewer of the student population), and
- ELLs who are enrolled for the first year in a U.S. school. These students will participate in their state's English language proficiency assessment.

Federal laws governing student participation in statewide assessments include the Elementary and Secondary Education Act (ESEA)-reauthorized as the No Child Left Behind Act (NCLB) of 2001, the Individuals with Disabilities Education Improvement Act of 2004 (IDEA), and Section 504 of the Rehabilitation Act of 1973 (reauthorized in 2008).
Since the Smarter Balanced assessment is based on the CCSS, the universal tools, designated supports, and accommodations that are appropriate for the Smarter Balanced assessment may be different from those that state programs utilized previously. For the summative assessments, state participants can only make available to students the universal tools, designated supports, and accommodations consistent with the Smarter Balanced UAAG. According to the UAAG (2014b p. 1), when the implementation or use of the universal tool, designated support, or accommodation is in conflict with a member state's law, regulation, or policy, a state may elect not to make it available to students.
The Smarter Balanced universal tools, designated supports, and accommodations currently available for the Smarter Balanced assessments have been prescribed. The specific universal tools, designated supports, and accommodations approved by Smarter Balanced may undergo change if additional tools, supports, or accommodations are identified for the assessment based on state experience or research findings. The Consortium has established a standing committee, including members from Consortium and staff, that reviews suggested additional universal tools, designated supports, and accommodations to determine if changes are warranted. Proposed changes to the list of universal tools, designated supports, and accommodations are brought to consortium members for review, input, and vote for approval. Furthermore, states may issue temporary approvals (i.e., one summative assessment administration) for individual, unique student accommodations. It is expected that states will evaluate formal requests for unique accommodations and determine whether the request poses a threat to the measurement of the construct. Upon issuing temporary approval, the petitioning state can send documentation of the approval to the Consortium. The Consortium will consider all state-approved temporary accommodations as part of the annual Consortium accommodations review process. The Consortium will provide to member states a list of
the temporary accommodations issued by states that are not Consortium-approved accommodations.

## Guidelines for Accessibility for English Language Learners.

In addition to the use of Universal Design features, Smarter Balanced has built a framework of accessibility for all students, including English Language Learners (ELLs) that were established in the Smarter Balanced Guidelines for Accessibility for English Language Learners (Young, Pitoniak, King, \& Ayad, 2012). ELLs have not yet acquired complete proficiency in English. For ELLs, the most significant accessibility issue concerns the nature of the language used in the assessments. The use of language that is not fully accessible can be regarded as a source of invalidity that affects the resulting test score interpretations by introducing construct-irrelevant variance. Although there are many validity issues related to the assessment of ELLs, the main threat to validity when assessing content knowledge stems from language factors that are not relevant to the construct of interest. The goal of these ELL guidelines was to minimize factors that are thought to contribute to such construct-irrelevant variance. Adherence to these guidelines helped ensure that, to the greatest extent possible, the Smarter Balanced assessments administered to ELLs measure the intended targets. The ELL Guidelines were intended primarily to inform Smarter Balanced assessment developers or other educational practitioners, including content specialists and testing coordinators.

For assessments, an important distinction is between content-related language that is the target of instruction versus language that is not content-related. For example, the use of words with specific technical meaning, such as "slope" when used in algebra or "population" when used in biology, should be used to assess content knowledge for all students. In contrast, greater caution should be exercised when including words that are not directly related to the domain. ELLs may have had cultural and social experiences that differ from those of other students. Caution should be exercised in assuming that ELLs have the same degree of familiarity with concepts or objects occurring in situational contexts. The recommendation was to use contexts or objects based on classroom or school experiences rather than ones that are based outside of school. For example, in constructing mathematics items, it is preferable to use common school objects, such as books and pencils, rather than objects in the home, such as kitchen appliances, to reduce the potential for construct-irrelevant variance associated with a test item. When the construct of interest includes a language component, the decisions regarding the proper use of language becomes more nuanced. If the construct assessed is the ability to explain a mathematical concept, then the decisions depend on how the construct is defined. If the construct includes the use of specific language skills, such as the ability to explain a concept in an innovative context, then it is appropriate to assess these skills. In ELA $\backslash$ literacy, there is greater uncertainty as to item development approaches that faithfully reflect the construct while avoiding language inaccessible for ELLs. The decisions of what best constitutes an item can rely on the content standards, definition of the construct, and the interpretation of the claims and assessment targets. For example, if interpreting the meanings in a literary text is the skill assessed, then using the original source materials is acceptable. However, the test item itself-as distinct from the passage or stimulus-should be written so that the task presented to a student is clearly defined using accessible language. Since ELLs taking Smarter Balanced content assessments likely have a range of English proficiency skills, it is also important to consider the accessibility needs across the entire spectrum of proficiency. Since ELLs by definition have not attained complete
proficiency in English, the major consideration in developing items is ensuring that the language used is as accessible as possible. The use of accessible language does not guarantee that constructirrelevant variance will be eliminated, but it is the best strategy for helping ensure valid scores for ELLs and for other students as well.

Using clear and accessible language is a key strategy that minimizes construct-irrelevant variance in items. Language that is part of the construct being measured should not be simplified. For non-content-specific text, the language of presentation should be as clear and as simple as is practical. The following guidelines for the use of accessible language were proposed as guidance in the development of test items. This guidance was not intended to violate other principles of good item construction. From the ELL Guidelines (Young, Pitoniak, King, \& Ayad, 2012, pp. 2-3), some general principles for the use of accessible language were proposed as follows.

- Design test directions to maximize clarity and minimize the potential for confusion.
- Use vocabulary widely accessible to all students, and avoid unfamiliar vocabulary not directly related to the construct (August, Carlo, \& Snow, 2005; Bailey, Huang, Shin, Farnsworth, \& Butler, 2007).
- Avoid the use of syntax or vocabulary that is above the test's target grade level (Borgioli, 2008). The test item should be written at a vocabulary level no higher than the target grade level, and preferably at a slightly lower grade level, to ensure that all students understand the task presented (Young, 2008).
- Keep sentence structures as simple as is possible while expressing the intended meaning. In general, ELLs find a series of simpler, shorter sentences to be more accessible than longer, more complex sentences (Pitoniak, Young, Martiniello, King, Buteux, \& Ginsburgh, 2009).
- Consider the impact of cognates (words with a common etymological origin) when developing items and false cognates. These are word pairs or phrases that appear to have the same meaning in two or more languages, but do not. Spanish and English share many cognates, and because the large majority of ELLs speak Spanish as their first language (nationally, more than $75 \%$ ), the presence of cognates can inadvertently confuse students and alter the skills being assessed by an item. Examples of false cognates include: billion (the correct Spanish word is millones; not billón, which means trillion); deception (engaño; not decepción, which means disappointment); large (grande; not largo, which means long); library (biblioteca; not librería, which means bookstore ).
- Do not use cultural references or idiomatic expressions (such as "being on the ball") that are not equally familiar to all students (Bernhardt, 2005).
- Avoid sentence structures that may be confusing or difficult to follow, such as the use of passive voice or sentences with multiple clauses (Abedi \& Lord, 2001; Forster \& Olbrei, 1973; Schachter, 1983).
- Do not use syntax that may be confusing or ambiguous, such as using negation or double negatives in constructing test items (Abedi, 2006; Cummins, Kintsch, Reusser, \& Weimer, 1988).
- Minimize the use of low-frequency, long, or morphologically complex words and long sentences (Abedi, 2006; Abedi, Lord \& Plummer, 1995).
- Teachers can use multiple semiotic representations to convey meaning to students in their classrooms. Assessment developers should also consider ways to create questions using multi-semiotic methods so that students can better understand what is being asked (Kopriva, 2010). This might include greater use of graphical, schematic, or other visual representations to supplement information provided in written form.

## Provision of Specialized Tests or Pools

Smarter Balanced provides a full item pool and a series of specialized items pools that allow students who are eligible for them to access the in tests with a minimum of barriers. These accessibility resources are considered embedded accommodations or embedded designated supports. The specialized pools that were available in 2014-15 are shown in Table 3.1.

TABLE 3.1 SPECIALIZED TESTS AVAILABLE TO QUALIFYING STUDENTS IN 2014-15

| Subject | Test instrument |
| :--- | :--- |
| ELA | ASL adaptive online (Listening only) |
| ELA | Braille adaptive online |
| ELA | Braille paper pencil |
| Math | Translated glossaries adaptive online |
| Math | Stacked Spanish adaptive online |
| Math | ASL adaptive online |
| Math | Braille adaptive online |
| Math | Spanish adaptive online |
| Math | Braille fixed form online |
| Math | Spanish paper pencil |
| Math | Braille paper pencil |

The technical quality of these tests is reported in Chapter 2. Online fixed forms and paper/pencil forms use the same item pools and share their psychometric properties. Given the small populations, the measurement properties for the adaptive tests in American Sign Language, Braille and Spanish is primarily gained through simulations.

## Fairness as a Lack of Measurement Bias: Differential Item Functioning Analyses

As part of the validity evidence from internal structure, differential item functioning (DIF) analyses were conducted on items using data from the 2014 field test. This section presents the evidence to support the frameworks' claims. DIF analyses are used to identify those items for which identifiable groups of students (e.g., males, females) with the same underlying level of ability have different probabilities of answering an item correctly or obtaining a given score level. Students data are aggregated according to the reported subgroups (e.g. ethnicity, gender, English Language Proficiency, etc) for DIF analyses. Students in each subgroup are then ranked relative to their total test score (conditioning on ability). Students in the focal group (e.g., females) are then compared to students in the reference group (e.g., males) relative to their performance on individual items. It is part of the Smarter Balanced framework to have ongoing study and review of findings to inform iterative, data-driven decisions.

If items are more difficult for some groups of students than for other groups of students, the items may not necessarily be unfair. For example, if an item were intended to measure the ability to comprehend a reading passage in English, score differences between groups based on real differences in comprehension of English would be valid and, therefore, fair. As Cole and Zieky (2001, p. 375) noted, "If the members of the measurement community currently agree on any aspect of fairness, it is that score differences alone are not proof of bias." Fairness does not require that all groups have the same average item score. Fairness requires assuring that differences in response patterns to be valid. Evaluations of validity include examination of differences in responses for groups of students matched on overall ability. An item would be unfair if the source of the difficulty were not a valid aspect of the item. For example, an item would be unfair if members of a group of test takers were distracted by an aspect of the item that they found highly offensive. If the difference in difficulty reflected real and relevant differences in the group's level of mastery of the tested CCSS, the item could be considered fair.

## Differential Item Functioning (DIF) Analyses for the Calibration Item Pool

Differential item functioning (DIF) analyses were performed on the items during field testing. DIF analyses are used to identify those items that identify groups of students (e.g., males versus females) with the same underlying level of ability that have different probabilities of answering an item correctly. To perform a DIF analysis, student data are aggregated according to the reported subgroups (e.g., ethnicity, gender, etc.). Students in each subgroup are then ranked relative to their total test score (conditioning on ability). Item performance from the focal group to be examined (e.g., females) is compared conditionally based on ability with the reference group (e.g., males). The definitions for the focal and references groups used are given in Table 3.2. A DIF analysis asks, "If we compare focal-group and reference-group students of the same overall ability (as indicated by their performance on the full test), are any test items appreciably more difficult for one group compared with another group?" DIF in this context is viewed as a potential source of invalidity.
DIF statistics are used to identify items that are functioning differentially. Subsequent reviews by content experts and bias/sensitivity committees are required to determine the source and meaning of performance differences. If the item is differentially more difficult for an identifiable subgroup when conditioned on ability, it may be measuring something different from the intended construct.

However, it is important to recognize that DIF-flagged items might be related to actual differences in relevant knowledge or statistical Type I error. Final decisions about the resolution of item DIF are made by a multi-disciplinary panel of content experts.

Table 3.2 Definition of focal and reference groups

| Group Type | Focal Groups | Reference Groups |
| :--- | :--- | :--- |
| Gender | Female | Male |
| Ethnicity | African American | White |
|  | Asian/Pacific Islander |  |
|  | Native American/Alaska Native |  |
|  | Hispanic |  |
| Special Populations | Limited English Proficient (LEP) | No IEP |
|  | Individualized Education Program (IEP) | Not Title 1 |
|  | Title 1 |  |

TABLE 3.3 DIF FLAGGING LOGIC FOR SELECTED-RESPONSE ITEMS

| DIF Category | Definition |
| :--- | :--- |
| A (negligible) | Absolute value of the MH D-DIF is not significantly different from zero, or is less <br> than one. |
| B (slight to moderate) | Absolute value of the MH D-DIF is significantly different from zero but not from <br> one, and is at least one; or <br> Absolute value of the MH D-DIF is significantly different from one, but less than <br> 1.5. <br> Positive values are classified as "B+" and negative values as "B-" " |
| C (moderate to large) | Absolute value of the MH D-DIF is significantly different from 1, and is at least <br> 1.5 ; and <br> Absolute value of the MH D-DIF is larger than 1.96 times the standard error of <br> MH D-DIF. <br> Positive values are classified as "C+" and negative values as "C-" |

## TABLE 3.4 DIF FLAGGING LOGIC FOR CONSTRUCTED RESPONSE ITEMS

| DIF Category | Definition |
| :--- | :--- |
| A (negligible) | Mantel p-value $>0.05$ or chi-square $\|S M D / S D\| \leq 0.17$ |
| B (slight to moderate) | Mantel chi-square $p$-value $<0.05$ and $\|S M D / S D\|>0.17$, but $\leq 0.25$ |
| C (moderate to large) | Mantel chi-square p-value $<0.05$ and $\|S M D / S D\|>0.25$ |

Items are classified into three DIF categories of "A," "B," or "C." DIF Category A items contain negligible DIF, Category B items exhibit slight or moderate DIF, and Category $C$ items have moderate to large values of DIF. Positive values favor the focus group, and negative values are in favor of the reference group. The positive and negative values are reported for C-DIF item flagging. DIF analyses were not conducted if the sample size for either the reference group or the focal group was less than 100 or if the sample size for the two combined groups was less than 400 . In subsequent tables, A levels of DIF are not flagged as they are too small to have perceptible interpretation.

Different DIF analysis procedures are used for dichotomous items (items with 0/1 score categories; selected-response items) and polytomous items (items with more than two score categories; constructed-response items). Statistics from two DIF detection methods are computed consisting of the Mantel-Haenszel procedure (Mantel \& Haenszel, 1959) and the standardized mean difference (SMD) procedure (Dorans \& Kulick, 1983, 1986) are used for dichotomous and polytomous items
respectively. Selected-response items are classified into DIF categories of A, B, and C, as described in Table 3.3.

For dichotomous items, the statistic described by Holland and Thayer (1988), known as MantelHaenszel D-DIF (MH D-DIF), is reported. This statistic is reported on the delta scale, which is a normalized transformation of item difficulty ( $p$-value) with a mean of 13 and a standard deviation of 4. Items that are not significantly different based on the MH D-DIF ( $p>0.05$ ) are considered to have similar performance between the two studied groups; these items are considered to be functioning appropriately. For items where the statistical test indicates significant differences ( $p<0.05$ ), the effect size is used to determine the direction and severity of the DIF. The formula for the estimate of constant odds ratio is

$$
\alpha_{M H}=\frac{\left(\sum_{m} \frac{R_{r m} W_{f m}}{N_{m}}\right)}{\left(\sum_{m} \frac{R_{f n} W_{r m}}{N_{m}}\right)},
$$

where
$R_{r m}=$ number in reference group at ability level $m$ answering the item right;
$W_{f m}=$ number in focal group at ability level $m$ answering the item wrong;
$R_{f m}=$ number in focal group at ability level $m$ answering the item right;
$W_{r m}=$ number in reference group at ability level $m$ answering the item wrong; and
$N_{m}=$ total group at ability level $m$.
This value can then be used as follows (Holland \& Thayer, 1988):

$$
M H D-D I F=-2.35 \ln \left[\alpha_{M H}\right] .
$$

The Mantel-Haenszel chi-square statistic used to classify items into the three DIF categories is

$$
M H \text { CHISQ } Q=\frac{\left(\left|\sum_{m} R_{r m}-\sum_{m} E\left(R_{r n}\right)\right|-\frac{1}{2}\right)^{2}}{\sum_{m} \operatorname{Var}\left(R_{r m}\right)},
$$

where $E\left(R_{r m}\right)=N_{r m} R_{N m} / N_{m}, \operatorname{Var}\left(R_{r m}\right)=\frac{N_{r m} N_{f m} R_{N m} W_{N n}}{N_{m}^{2}\left(N_{m}-1\right)}, N_{r m}$ and $N_{f m}$ are the numbers of examinees in the reference and focal groups, respectively, $R_{N n}$ and $W_{N m}$ are the number of examinees who answered the item correctly and incorrectly, respectively. The classification logic used for flagging items is based on a combination of absolute differences and significance testing. Items that are not statistically different based on the MH D-DIF ( $p>0.05$ ) are considered to have similar performance between the two studied groups; these items are considered to be functioning appropriately. For items where the statistical test indicates significant differences ( $p<0.05$ ), the effect size is used to determine the direction and severity of the DIF. The classification logic for selected-response items is based on a combination of absolute differences and significance testing, is shown in Figure 3.1.

The standardized mean difference compares item performance of two subpopulations adjusting for differences in the distributions of the two subpopulations. The standardized mean difference statistic
can be divided by the total standard deviation to obtain a measure of the effect size. A negative value of the standardized mean difference shows that the item is more difficult for the focal group, whereas a positive value indicates that it is more difficult for the reference group. The standardized mean difference used for polytomous items is defined as:

$$
S M D=\sum p_{F K} m_{F K}-\sum p_{F K} m_{R K},
$$

where $p_{F k}$ is the proportion of the focal group members who are at the $\mathrm{k}^{\text {th }}$ level of the matching variable, $m_{F k}$ is the mean score for the focal group at the $k^{\text {th }}$ level, and $m_{R k}$ is the mean item score for the reference group at the $\mathrm{k}^{\text {th }}$ level. The standardized mean difference is divided by the total item group standard deviation to get a measure of the effect size. The classification logic for polytomous items is based on a combination of absolute differences and significance testing, as shown in Table 3.4. Items that are not statistically different are considered to have similar performance between the two studied groups; these items are considered to be functioning appropriately.

A relatively small number of items showed some performance differences between student groups as indicated by C-DIF flagging criteria. Table 3.5 and Table 3.6 show the number of items flagged for all categories of DIF for ELA/literacy and mathematics in grades $3-8$ and 11. A relatively small percentage of items with moderate or significant levels of DIF (B or C DIF) were included in summative pools. All items had previously undergone bias reviews. Content editors inspected $B$ and C DIF items before including them in operational tests administrations. This inspection is to assure that statistical differences are not caused by any content issues of bias or sensitivity. Only items approved by a multi-disciplinary panel of experts are eligible to move into operational pools.

Table 3.5 Number of DIF items in summative pools flagged by category (ELA, grades 3-8 and 11)

| Grade | DIF <br> Category | Focal group/Referent Group |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Note: In February, 2016, the Consortium's Technical Advisory Committee suggested that these criteria may be too conservative. Based on this advice, the Consortium may loosen its thresholds for determining DIF. Any such change will be reported in subsequent technical manuals.

## Test Fairness and Implications for Ongoing Research

There are many features of the Smarter Balanced assessments that support equitable assessment across all groups of students. The assessments are developed using the principles of evidencecentered design and universal test design. Test accommodations are provided for students with disabilities, and language-tools and supports were developed for ELLs. The Consortium developed a set of guidelines to facilitate accessibility to the assessments. In addition to these general accessibility guidelines embedded in the conceptual framework, procedures for item writing and reviewing and guidelines for creating audio, sign language, and tactile versions of the items were implemented. Smarter Balanced developed guidelines for item development that aim toward reducing construct-irrelevant language complexities for English language learners (Young, Pitoniak, King, \& Ayad, 2012) and comprehensive guidelines for bias and sensitivity (ETS, 2012), and a rubric specifically geared towards scoring language complexity (Cook \& MacDonald, 2013). In addition, measurement bias was investigated using DIF methods. This evidence underscores the commitment to fair and equitable assessment for all students, regardless of their gender, cultural heritage, disability status, native language, and other characteristics. Irrespective of these proactive development activities designed to promote equitable assessments, further validity evidence that the assessments are fair for all groups of students should be provided. To evaluate the degree to which the Smarter Balanced assessments are fulfilling the purpose of valid, reliable, and fair information that is equitable for all students, several types of additional evidence are recommended based on the relevant types listed in the AERA, APA, \& NCME (2014) Standards. Validity studies are described here as well as ones that can be addressed in the ongoing research agenda for Smarter Balanced .

## Chapter 4: Test Design

## Introduction

Test design entails developing a test philosophy (i.e., Theory of Action), identifying test purposes, and determining the targeted examinee populations, test specifications, item pool design, and other features such as test delivery (Schmeiser \& Welch, 2006). The Smarter Balanced Theory of Action, test purposes, and the targeted examinee population were outlined in the introduction of this report. Other elements of test design are further emphasized here, such as the interim assessments. In developing a system of assessments, the goal of Smarter Balanced was to ensure that its measurement properties reflected the expectations of content, rigor, and performance that comprise the Common Core State Standards (CCSS). The primary mechanism for this was to ensure the alignment of the Smarter Balanced assessments with the CCSS. Figure 4.1 briefly encapsulates the Smarter Balanced content structure.

Figure 4.1 Components of Smarter Balanced test design

## A Brief Description of Smarter Balanced Content Structure

The Common Core State Standards are the content standards in English language arts/literacy (ELA) and mathematics that many states have adopted. Because the CCSS were not specifically developed for assessment, they contain extensive rationale and information concerning instruction. Therefore, adopting previous practices used by many state programs, Smarter Balanced content experts produced Content Specifications in ELA/Literacy and mathematics, distilling assessment-focused elements from the CCSS. The Smarter Balanced Content Specifications for the Summative Assessment of the CCSS for English Language Arts/Literacy (2015c) and Content Specifications for the Summative Assessment of the CCSS for Mathematics (2015d) were expressly created to guide the structure and content of assessment development. Within each of the two subject areas in grades 3 to 8 and high school, there are four broad claims. Within each claim, there are a number of assessment targets. The claims in ELA and mathematics are given in Table 4.1.

Table 4.1 CLAIms FOR ELA/LIteracy and mathematics

| Claim | ELA/Literacy | Mathematics |
| :---: | :--- | :--- |
| 1 | Reading | Concepts and Procedures |
| 2 | Writing | Problem Solving |
| 3 | Research | Communicating Reasoning |
| 4 |  | Modeling and Data Analysis |

Currently, only the listening part of ELA Claim 3 is assessed. In mathematics, Claims 2 and 4 are reported together, so there are only three reporting categories for mathematics, but four claims.

Because of the breadth in coverage of the individual claims, targets within each claim statement were needed to define more specific performance expectations. The relationship between targets and Common Core State Standards elements is made explicit in the Smarter Balanced content specifications (2015c; 2015d).

The Smarter Balanced Item and Task Specifications (2015e) for ELA/literacy and mathematics provide guidance on how to translate the Smarter Balanced Content Specifications into actual assessment items. In addition, guidelines for bias and sensitivity, accessibility and accommodations, and style help item developers and reviewers ensure consistency and fairness across the item bank. The specifications and guidelines were reviewed by member states, school districts, higher education, and other stakeholders. The item specifications describe the evidence to be elicited and provide sample task models to guide the development of items that measure student performance relative to the target.

Smarter Balanced Smarter Balanced ELA/Literacy Summative Assessment Blueprint (2015a) and Mathematics Summative Assessment Blueprint (2015b) describe the content of the English language arts/literacy and math summative assessments for grades 3-8 and high school-and how that content will be assessed. The blueprints also describe the composition of the two assessment components, computer adaptive test (CAT) and performance task (PT), and how their results will be combined for score reporting. For the computer adaptive component, specific items administered to each student are uniquely determined based on an item-selection algorithm and content constraints embedded in the test blueprint. The performance tasks (PTs) act in concert with the computer adaptive test (CAT) items to fulfill the blueprint. Developed with broad input from member states, partners, and stakeholders, the summative test blueprints reflect the depth and breadth of the performance expectations of the CCSS. Smarter Balanced Governing Members adopted the preliminary test blueprints in 2012 and the summative test blueprints reflect refinements and revisions after the analysis of the Pilot and Field Tests.

## Synopsis of Assessment System Components

The summative assessment for each content area consists of two parts: a CAT and a PT. The PT is administered on a computer but is not computer adaptive. The summative assessment is administered according to the guidance provided in the Smarter Balanced State Procedures Manual (2014). The summative assessment scores

- accurately describe student achievement and can describe growth of student learning as part of program evaluation and school, district, and state accountability systems;
- provide valid, reliable, and fair measures of students' progress toward, and attainment of, the knowledge and skills required to be college- and career-ready;
- Measure the breadth and depth of the CCSS across the full spectrum of student ability by incorporating a variety of item types (including items and tasks scored by expert raters) that are supported by a comprehensive set of accessibility resources;
- capitalize on the strengths of computer adaptive testing-efficient and precise measurement across the full range of student achievement; and
- utilize performance tasks to provide a measure of the student's ability to integrate knowledge and skills.

## Evidence-Centered Design in Constructing Smarter Balanced Assessments

Evidence-centered design (ECD) is an approach to the creation of educational assessments in terms of reasoning about evidence (arguments) concerning the intended constructs. The ECD begins with identification of claims, or inference users want to make concerning student achievement. Evidence needed to support those claims is then specified, and finally, items/tasks capable of eliciting that information are designed (Mislevy, Steinberg, \& Almond, 2003). Explicit attention is paid to the potential influence of unintended constructs. ECD accomplishes this in two ways. The first is by incorporating an overarching conception of assessment as an argument from imperfect evidence. This argument makes explicit the claims (the inferences that one intends to make based on scores) and the nature of the evidence that supports those claims (Hansen \& Mislevy, 2008; Mislevy \& Haertel, 2006). The second is by distinguishing the activities and structures involved in the assessment enterprise in order to exemplify an assessment argument in operational processes. By making the underlying evidentiary argument more explicit, the framework makes operational elements more amenable to examination, sharing, and refinement. Making the argument more explicit also helps designers meet diverse assessment needs caused by changing technological, social, and legal environments (Hansen \& Mislevy, 2008; Zhang, Haertel, Javitz, Mislevy, Murray, \& Wasson, 2009). The ECD process entails five types of activities. The layers focus in turn on the identification of the substantive domain to be assessed; the assessment argument; the structure of assessment elements such as tasks, rubrics, and psychometric models; the implementation of these elements; and the way they function in an operational assessment, as described below. For Smarter Balanced, a subset of the general ECD elements was used.

- Domain Analysis. In this first layer, domain analysis involves determining the specific content to be included in the assessment. Smarter Balanced uses the Common Core State Standards
as its content domain for mathematics and ELA/literacy. Domain analysis was conducted by the developers of the CCSSs, who first developed college- and career-readiness standards, to address what students are expected to know and be able to do by the time they graduate from high school. This was followed by development of the K-12 standards, which address expectations for students in elementary through high school.
- Domain Modeling. In domain modeling, a high-level description of the overall components of the assessment is created and documented. For Smarter Balanced, the components include computer-adaptive summative and interim assessments in mathematics and ELA/literacy. The domain framework was developed by organizing the CCSS into domain areas that form the structure of test blueprints and reporting categories. This overall structure was created in the course of Smarter Balanced content specification development.
- The Conceptual Assessment Framework. Next, the conceptual assessment framework is developed. For Smarter Balanced, this step was accomplished in developing the Smarter Balanced content specifications, which identify major claim structure, targets within claims, and the relationship of those elements to underlying content of the CCSS. In this step, the knowledge, skills, and abilities to be assessed (i.e. intended constructs, targets of assessment), the evidence that needs to be collected, and the features of the tasks that will elicit the evidence are specified in detail. Ancillary constructs that may be required to respond correctly to an assessment task but are not the intended target of the assessment are also specified (e.g., reading skills in a mathematics examination). By identifying any ancillary knowledge, skills, and abilities (KSAs), construct-irrelevant variance can be identified a priori and minimized during item and task development-potential barriers created by the ancillary KSAs can be removed or their effects minimized through the provision of appropriate access features. The item and task specifications describe the evidence required to support claims about the assessment targets and also identify any ancillary constructs.
- Implementation. This layer involves the development of the assessment items or tasks using the specifications created in the conceptual assessment framework just described. In addition, scoring rubrics are created and the scoring process is specified. Smarter Balanced items, performance tasks, and associated scoring rubrics were developed starting in the spring of 2012.
- Delivery. In this final layer, the processes for the assessment administration and reporting are created. The delivery system describes the adaptive algorithm, collection of student evidence, task assembly, and presentation models required for the assessment and how they function together. The ECD elements chosen lead to the best evaluation of the construct for the intended test purposes. Test delivery and test scoring are discussed below.

## Test Blueprints

Test specifications and blueprints define the knowledge, skills, and abilities intended to be measured on each student's test event. A blueprint also specifies how skills are sampled from a set of content standards (i.e., the CCSS). Other important factors such as Depth of Knowledge (DOK) are
also specified. Specifically, a test blueprint is a formal document that guides the development and assembly of an assessment by explicating the following types of essential information:

- content (claims and assessment targets) that is included for each assessed subject and grade, across various levels of the system (student, classroom, school, district, state);
- the relative emphasis or weighting of different content strata (e.g., claims) if there is any weighting beyond the proportions of items and points;
- the relative emphasis of content standards generally indicated as the number of items or percentage of points per claim and assessment target;
- item types used or required, which communicate to item developers how to measure each claim and assessment target, and to teachers and students about learning expectations; and
- Depth of Knowledge (DOK), indicating the complexity of item types for each claim and assessment target.

The test blueprint is an essential guide for both assessment developers and for curriculum and instruction. For assessment developers, the blueprint and related test-specification documents define how the test will ensure coverage of the full breadth and depth of content and how it will maintain fidelity to the intent of the CCSS on which the Smarter Balanced assessment is based. Full content alignment is necessary in order to ensure that educational stakeholders can make valid, reliable, and unbiased inferences about student, classroom, school, and state performance. At the instructional level, the test blueprint provides a guide to the relative importance of competing content demands and suggests how the content is demonstrated, as indicated by item type and depth-of-knowledge. In summary, an assessment blueprint provides clear development specifications for test developers and signals to the broader education community both the full complexity of the CCSS and how performance on these standards are substantiated.

Part of the innovative aspect of the Smarter Balanced assessments is that the test blueprints sample the content domain using both a computer adaptive component (CAT) and a performance task (PT). The test blueprints can be inspected to determine the contribution of the CAT and PT components in a grade and content area toward the construct intended to be measured. Another aspect of the assessments is the provision of a variety of both machine-scored and human-scored item types. The contribution of these item types is specified in the Smarter Balanced test blueprints.

In February 2015, the Governing Members of the Smarter Balanced Assessment Consortium adopted blueprints for the summative assessments of mathematics and ELA/literacy for grades 3 to 8 and high school. These were fully implemented in the 2014-15 school year. The complete blueprints details for each grade and content area (Smarter Balanced, 2015a; Smarter Balanced, 2015b).

The summative assessment is composed of the CAT and PT components. Responses from both components are combined to cover the test blueprint in a grade and content area and are used to produce the overall and claim scale scores. Figure 4.2 is a conceptual diagram of how claims are distributed across the adaptive and performance task parts of the tests.

Figure 4.2 CLAIm distribution in test blueprints

## Operational Summative Assessment Blueprints and Specifications.

For each designated grade range ( 3 to 5,6 to 8 , and high school), the blueprint overviews summarize the claim score $\backslash$ reporting category, content category, stimuli used, items by CAT or performance tasks, and total number of items by claim. Details are given separately for each grade and include claim, assessment target, DOK, assessment type (CAT/PT), and the total number of items (Smarter Balanced, 2015a; Smarter Balanced, 2015b). Assessment targets are nested within claims and represent a more detailed specification of content. Note that in addition to the nested hierarchical structure, each blueprint also specifies a number of rules applied at global or claim levels. Most of these specifications are in the footnotes, which constitute important parts of the test designs.

The CAT algorithm selects items necessary to conform to the test blueprint and at the same time meet the IRT target information function. In establishing target requirements for the CAT, designers took advantage of the adaptive pool to allow more variety than would be present in a fixed form test. For example, when the number of targets in a domain area is large, blueprints allow choice within target clusters rather than limiting the number of targets. Since all targets are represented in the pool, any student could potentially get any target while the full set of content constraints is still maintained.

To assist in blueprint interpretation, an example of a mathematics summative blueprint is given in Figure 4.3. Figure 4.4 and

Figure 4.5 present blueprint requirements for grade six mathematics, by claim and assessment target. It displays the number of items overall by claim and shows the contribution of the CAT and performance task portions to the overall design. Note that some targets are clustered together. For example, Claim 1 calls for 14 items from targets E, F, A, G, B, and D. Note that six items come from targets $E$ and $F$, while only two items come from targets $G$ and $B$. This represents the appropriate content emphasis, while allowing flexibility in item choice. The detailed blueprint shows how performance tasks and CAT components work in conjunction. Here, the DOK requirements are applied at the target level. Performance tasks are delivered as a fixed set of items within a theme common to a class or school.

Figure 4.3 Overview of mathematics grade 6-8 summative blueprint

| Blueprint Table Mathematics Grades 6-8 <br> Estimated Total Testing Time: 3:30 (with Classroom Activity) ${ }^{1}$ |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Claim/Score Reporting Category | Content Category ${ }^{2}$ | Stimuli |  | Items |  | Total Items by Claim ${ }^{3}$ |
|  |  | CAT | PT | CAT ${ }^{4}$ | PT ${ }^{5}$ |  |
| 1. Concepts and Procedures | Priority Cluster | 0 | 0 | 12-15 | 0 | 16-20 |
|  | Supporting Cluster | 0 |  | 4-5 |  |  |
| 2. Problem Solving <br> 4. Modeling and Data Analysis ${ }^{6}$ | Problem Solving | 0 | 1 | 6 | 2-4 | 8-10 |
|  | Modeling and Data Analysis | 0 |  |  |  |  |
| 3. Communicating Reasoning | Communicating Reasoning | 0 |  | 8 | 0-2 | 8-10 |

${ }^{1}$ All times are estimates. Actual times may vary.
${ }^{2}$ For more information on content categories, see the Content Specifications document at http://www.smarterbalanced.org/smarter-balanced-assessments/.
${ }^{3}$ While the range for the total items by Claim for Problem Solving/Modeling and Data Analysis and Communicating Reasoning indicates 8-10 items in each reporting category, the total number of items across these two reporting categories for any individual test event is 18-20.
${ }^{4}$ In grades 6-8, up to one CAT item per student may require hand-scoring (from either Claim 3 or Claim 4), which may be AIscored with an application that yields comparable results by meeting or exceeding reliability and validity criteria for handscoring.
${ }^{5}$ Each PT contains 4-6 total items. Up to four PT items may require hand-scoring.
${ }^{6}$ Claim 2 (Problem Solving) and Claim 4 (Modeling and Data Analysis) have been combined because of content similarity and to provide flexibility for item development. There are still four claims, but only three claim scores will be reported with the overall math score.

- DOK: Depth of Knowledge, consistent with the Smarter Balanced Content Specifications.
- The CAT algorithm will be configured to ensure the following:
- For Claim 1, each student will receive at least 7 CAT items at DOK 2 or higher.
- For Claim 3, each student will receive at least 2 CAT items at DOK 3 or higher.
- For combined Claims 2 and 4 , each student will receive at least 2 CAT items at DOK 3 or higher.

## CAT and Performance Task Test Components

Part of the Smarter Balanced Theory of Action is to leverage appropriate technology and innovation. The use of CAT methodologies helps ensure that students across the range of proficiency have an assessment experience with items well targeted to their skill level. Adaptive testing allows average-, very low-, and very high-performing students to stay engaged in the assessment because they respond to items specifically targeted to their skill level. Non-adaptive performance tasks measure a student's ability to integrate knowledge and skills across multiple standards. No order is imposed on the components; either the CAT or PT portion can be administered to students first.

CAT tests are more efficient in that they provide a higher level of score precision than fixed form tests with the same number of items. For the CAT component, there are both content constraints (e.g., a long reading passage in ELA must be administered) as well as psychometric criteria that must be optimized for each student. Performance tasks are intended to measure multiple standards in a coherent task that requires use of integrated skill sets. Performance tasks measure capacities such as essay writing, research skills, and complex analysis, which are not as easy to assess with individual, discrete items. Several performance tasks are associated with a common theme. A theme is assigned to school for each grade and the performance tasks within the theme are randomly distributed within the grade.

## Adaptive Test Design and Algorithm Overview

Automated test assembly for a CAT depends on a number of factors to produce optimal tests. These depend on the quality of the item bank, reasonableness of the test constraints and precision targets, and the degree to which content or other qualitative attributes of items are salient and can be defined as constraints (Luecht, 1998).

For the operational test, an item-level, fully adaptive test component was administered in ELA/literacy and mathematics. The adaptive part delivers blueprints in a manner that efficiently minimizes measurement error and maximizes information. Smarter Balanced provides a specific CAT delivery engine, but states may choose to use other engines as long as they can deliver a conforming test blueprint with a minimum degree of error, avoid item over- or under-exposure, and provide the design features specified by Smarter Balanced. This section outlines some of the design features for the operational adaptive test component.

Early in the development process, Consortium members determined that students should be allowed to go back to earlier questions, review their answers and revise their answers if necessary. This has implications for test design and delivery. If a student takes a test over the course of two or more days, answers from previous days cannot be changed. In mathematics, some items permit the use of a calculator, while others forbid calculator use. Mathematics tests are consequently divided into two sections, one for non-calculator items, and one that permits calculator use. Students can change answers within sections but not across different test sections.

This section describes the adaptive algorithm design for the Smarter Balanced Test Delivery System. To assert the administration of comparable tests, members must adopt an algorithm that delivers the published blueprint. Three potential scenarios through which this could be accomplished are listed below:

- Members may deliver Smarter Balanced assessments using the open source software for both the test delivery system and adaptive algorithm.
- Members may use the open source software for one component and a service provider solution for the other (e.g., open source test delivery system, and a vendor's algorithm that can be appropriately configured).
- Members may use service provider solutions for both components, provided that in concert, they can deliver the published blueprint as expected.

This section describes the method used in the Smarter Balanced system to satisfy the blueprint and provide optimal precision. The implementation described here is released under the Creative Commons Attribution Only, No Derivatives license. This document is a summary with supplemental explanations and examples of explicit functionality found in the separate, Smarter Balanced Adaptive Item Selection Algorithm Design Report by Jon Cohen and Larry Albright (2014). Interested readers can refer to the more detailed document for more technical information and specific formulas the algorithm employs.

In general, an adaptive algorithm is the method used to carry out a blueprint design by acting on an item pool. The algorithm finds the items expected to compose the best test for each student, selecting items from the pool that match blueprint demands while using information from a student's responses to find the most accurate score. The blueprint describes in detail the content and other attributes for each student's test. Both the algorithm and items in the pool must support blueprints in order to deliver accurate, efficient tests.

Item attributes specified in blueprints and needed to run the algorithm include depth of knowledge, response type, scoring type, common stimulus membership and mathematical domain. All items in the bank must have complete information about these elements available to algorithm software. The minimum and maximum number of items in each element is specified in the adaptive software, serving as a constraint to balance aspects such as blueprint coverage with test length. Each element can be given weights used in the selection process that affects test delivery. By allowing for the specification of weights, the general algorithm can be customized for varying conditions of population and pool distribution. This function can help assure that a test best matches the purpose for which it is designed. For example, weights can be shifted to emphasize measurement precision or content coverage, depending on policy priorities. Final weights were established during the last stages of test design when all item parameters were known and simulation results were available.

Item measurement data: In addition to the blueprint attributes listed above, each item has a set of parameters that provide measurement information. The purpose of the algorithm is to satisfy the content blueprint while providing the most accurate student score, in the most efficient manner. In measurement terms, the most information is obtained when the difficulty of the item is close to the functional level of the student. At the beginning of the test, item difficulty and discriminating power are known, and student ability is unknown. The job of the algorithm is to find out the student's ability in the content area being assessed.

## Test Operation Walkthrough

Preparation: The system must have in place a sufficient item pool with the full set of parameters and metadata. Smarter pools contain all items for the intended grade level and items from adjacent grades that address on-grade content. Items from upper grades address content the student has had an opportunity to learn. Items from lower grades are screened for age-appropriateness. Initially, the pool is filtered to contain only items written for the intended grade. Under certain circumstances (described below) the filter is dropped and the adjacent grade items are added. The adaptive engine needs to be populated with all hierarchical and content elements, including the minimum and maximum number of items allowed for each facet of the blueprint.

Initialization. Adaptive tests require methods for avoiding overuse of items. In the 2014-15 summative tests, the algorithm was configured to choose each test's initial item randomly from the pool. The initial claim is chosen at random as long as passages and hand-scored items are not presented first. The algorithm then cycles through the claims.

Item selection. The initialization and selection processes control underuse and overuse of items, also known as exposure control. Exposure control enhances item security, discouraging copying and cheating by presenting a variety of items. It also leads to more efficient pool use, assuring that all items developed to cover the content are used. Rather than choosing the single best item for initialization and selection, which would cause some items to be used repeatedly and others rarely or never, the algorithm selects randomly from targeted sets of items. To prevent overuse of highly discriminating items, the discrimination (a) parameter is not taken into account in selection ranking. The optimal size of the first content-based set and the subsequent subset, which takes information into account, was determined through simulation with actual pool parameters.

Once the initial item response has been given, the selection process is launched and will be repeated for every subsequent response. The software uses the set of weights described earlier to determine a group of items with the best match to the blueprint, excluding items from target groups that have reached the maximum number of items specified in the blueprint and items previously seen by the examinee. When this mini pool (subset of items) has been chosen, information value is calculated for each item using the current student ability estimate and known item parameters. Overall item value is calculated using both information and content data. The item set is then sorted according to overall value and a set of the most preferred items are identified. The item to be administered is chosen randomly from within this set. After each response to a machine-scored item, the student ability estimate is updated. The selection procedure is then repeated until the blueprint has been satisfied. Students can go back and change their answers within a test segment. When this occurs for machine-scored items, the ongoing student score estimate is updated with the new response.

Note that blueprints call for the administration of human-scored items during the adaptive part of the test. The blueprints specify that these items may be AI scored with an application that yields comparable results by meeting or exceeding reliability and validity criteria for hand-scoring. These items are chosen based on their information value just like machine-scored items. However, the adaptive engine is designed to work asynchronously from hand-scoring. Because the response to
the item is not immediately scored, the adaptive engine proceeds using the most recent estimate of student ability and selects the next item accordingly.

The algorithm proceeds in this manner until a percentage of the test (coverage in mathematics, 61\%; ELA, 62\%.) has been administered, sampling items from all claim areas. At this point the distance of the estimated score from the college content readiness cut score is evaluated. This is Level 3 as defined in the Smarter Balanced Achievement Level Setting Final Report (2015f), If there is a determination that the student is in either Level 1 or Level 4 as defined by the Achievement Level Setting Report, the item pool is expanded to include items from no more than two adjacent grades in either direction. In grade 3, the expansion includes items from adjacent upper grades only; in grade 11 only adjacent lower grades are included. Items from adjacent grades have been screened for appropriateness by content experts to assure that they are instructionally and developmentally appropriate for the target grade. For the remainder of the test, both on-grade and off-grade items can be administered. The item with the best content and measurement characteristics is chosen from the pool. When a determination of being in Level 1 or level 4 cannot be made, the test continues with on-grade items. The algorithm delivers the remainder of the blueprint until termination.

Termination: The test ends when the blueprint has been met. At that point, student machine-scored responses are retained.

Test Scoring: The method of combining item level scores to produce test scores and sub-scores is presented in detail in the Smarter Balanced Scoring Specification document (AIR, 2014). Scores are calculated using maximum likelihood estimation (MLE) applied at the overall and sub-score levels. No special weights for claims, item types or performance tasks are applied. Desired domain representations is achieved by content proportions in the blueprints.

## Item and Task Development

In order to build a summative assessment that measured the intended claims, the Consortium's test development cycle was iterative, involving experts from various education-related fields, and was based on assessment-related research and best practices.

## Item and Task Specifications

The item and task specifications bridge the span from the content specifications and Achievement Level Descriptors (ALDs) to the assessment itself. While the content specifications established the Consortium's claims and the types of evidence or targets, that would need to be collected in order to support these claims, more specificity was needed in order to develop items and tasks that measured the claims.

The first iteration of the item and task specifications was developed in 2011. In early 2012, the Consortium held a series of showcases where the contractors introduced the item and task specifications and collected feedback from member states. Using this feedback, the item and tasks specifications were revised during the first quarter of 2012.

Using the revised item and task specifications, a small set of items was developed and administered in fall 2012 during a small-scale trial. This provided the Consortium with the first opportunity to
administer and score the new item types. During the small-scale trials, the Consortium also conducted cognitive laboratories to better understand how students respond to various types of items (AIR, 2013). The cognitive laboratories used a think-aloud methodology in which students speak their thoughts while working on a test item. The item and task specifications were again revised based on the findings of the cognitive laboratories and the small-scale trial. These revised specifications were used to develop items for the 2013 pilot test, and they were again revised based on 2013 pilot test results and subsequent review by content experts.

The Smarter Balanced Item and Task Specifications (2015e) are designed to ensure that assessment items measure the assessment's claims. Indeed, the purpose of item and task specifications is to define the characteristics of items and tasks that will provide evidence to support one or more claims. To do this, the item and task specifications delineate types of evidence that should be elicited for each claim within a grade level. Then, they provide explicit guidance on how to write items in order to elicit the desired evidence.

Item and task specifications provide guidelines on how to create items specific to each claim and assessment target through the use of task models. In mathematics a task model provides a description of an item/task's key features. These task models describe the knowledge, skills, and processes being measured by each of the item types aligned to particular targets. In addition, task models sometimes provide examples of plausible distractors. Exemplar items are provided within every task model. In ELA these functions are carried out through item specifications.

Task models were developed for each grade level and target to delineate the expectations of knowledge and skill to be included on test questions in each grade. In addition, both ELA/literacy and mathematics item and stimulus specifications provide guidance about grade appropriateness of task and stimulus materials (the materials that a student must refer to in working on a test question). The task and stimulus models also provide information on characteristics of stimuli or activities to avoid because they are not germane to the knowledge, skill, or process being measured.

This is important because it underscores the Consortium's efforts to use universal design principles to develop items that are accessible to the widest range of students possible. As the name suggests, the concept of universal design aims to create items that accurately measure the assessment target for all students. At the same time, universal design recognizes that one solution rarely works for all students. Instead, this framework acknowledges "the need for alternatives to suit many different people." (Rose \& Meyer, 2000, p. 4).

To facilitate the application of universal design principles, item writers are trained to consider the full range of students who may answer a test question. A simple example of this is the use of vocabulary that is expected to be known by all third-grade students versus only those third-grade students who play basketball. Almost all third-grade students are familiar with activities (e.g., recess) that happen during their school day, while only a subset of these students will be familiar with basketball terms like "double dribble," "layup," "zone defense," or "full-court press."

Item specifications discuss accessibility issues unique to the creation of items for a particular claim and/or assessment target. Accessibility issues concern supports that various groups of students may need to access item content. By considering the supports that may be needed for each item, item writers are able to create items that can be adapted to a variety of needs.

The use of universal design principles allows the Consortium to collect evidence on the widest possible range of students. By writing items that adhere to item and task specifications, the Consortium is assured that assessments measure the claims and assessment targets established in content specifications as well as the knowledge, skills, and processes found in the CCSS for all students for whom the assessment is appropriate.

## Performance Task Design

The Race to the Top Assessment Program Application for the Smarter Balanced Assessment Consortium (2010) highlights the importance of performance tasks to "provide a measure of the student's ability to integrate knowledge and skills across multiple standards-a key component of college and career readiness" (p. 42). The development of an assessment system that fulfills this goal necessitates an understanding of how the world is changing and what skills are required to compete in an increasingly global economy. Research suggests that measuring college and career readiness will increasingly require the use of performance-based assessments (Fadel, Honey, \& Pasnik, 2007).

A key component of college and career readiness is the ability to integrate knowledge and skills across multiple content standards. Smarter Balanced derives inferences concerning this ability through performance tasks. Performance assessments are intended to represent students' competence in applying the knowledge and cognitive skills needed to solve substantive, meaningful problems. Performance assessments give students opportunities to demonstrate their ability to find, organize, or use information to solve problems, undertake research, frame and conduct investigations, analyze and synthesize data, and apply learning to novel situations.

A Smarter Balanced performance task involves interaction of students with stimulus materials and/or engagement in a problem solution, ultimately leading to an exhibition of the students' application of knowledge and skills. Stimuli include a variety of information forms (e.g., readings, video clips, data), as well as an assignment or problem situation. As shown in the test blueprints, performance tasks are an integral part of the Smarter Balanced test design. When a performance task is assigned and given in its entirety, it fulfills a specific role in the test blueprint for a grade and content area. Performance tasks are intended to challenge students in applying their knowledge and skills to complex, contextually rich problems. These activities are meant to measure capacities such as depth of understanding, writing or research skills, mathematical modeling and complex analysis. They consist of collections of questions and activities coherently connected to a single scenario. The performance tasks are administered online via computer (not computer adaptive) and require one to two class periods to complete.

Performance tasks were constructed so they can be delivered effectively in the school/classroom environment (Dana and Tippins, 1993). Requirements for task specifications included, but were not limited to, pre-assessment classroom activities, materials and technology needs, and allotted time for assessment. Performance tasks adhere to specifications used by item writers to develop new tasks that focus on different content but are comparable in contribution to the blueprint.

All Smarter Balanced performance tasks consist of three basic components: stimulus presentation, information processing, and scorable product(s) or performance(s). "Information processing" means student interactions with the stimulus materials and their content. It could include note taking, data
generation, and any other activities that increase students' understanding of the stimulus content or the assignment. All activities within a task must have a rationale for inclusion (e.g., to increase understanding, for scaffolding, as early steps in product creation or for product creation).

In ELA, each performance task comprises a targeted research effort in which students read sources and respond to two to three research items, followed by an essay. During the research component, students may take notes to which they may later refer. Students then write a full essay drawing from source material and research notes. Claim level results in writing and research are based on both CAT and performance task item responses.

In mathematics, each performance task comprises a set of stimulus materials and a follow-up item set consisting of six items in Claims 2, 3, and 4. These are combined with CAT items in Claims 2, 3 and 4 to satisfy the blueprint and create a Claim 3 score and a combined Claim 2 and 4 score. Performance tasks address an integrated scenario in middle and high school and a common theme in grades 3 to 5 .

## The Item/task Pool Specification

An item pool refers to a collection of test questions (known as items) that supports the test blueprint for a particular content area and grade. The Consortium took multiple steps to ensure the quality of the items in our item pool. Building on the ongoing process of developing item/task specifications and test blueprints, the Consortium used an iterative process for creating and revising each item as well as the collection of items. The Consortium tested items and refined its approach to item development through three steps: small-scale tryouts, a large pilot test, and a large field test. Details of the pilot and field tests are found in the Smarter Balanced 2013-2014 Technical Report (2016). During each phase, the Consortium used cognitive laboratories to understand the strategies that students used to respond to the items. By incorporating this tiered and iterative approach, the item and task specifications that guided the development of the final operational pool were improved based on lessons learned during tryouts.

Using test blueprints, measurement experts specified the number and distribution of items to be written. Pools of items/tasks were written specifically to support proportions of items and intended difficulty distribution in the operational blueprint. Teachers were integrally involved in the creation of the item/task pool from beginning to end. Some participated in the processes described in the flow charts that appear in the Appendix A. Others developed items through a rigorous item writing process, and yet others reviewed the items for accuracy and appropriateness of the content knowledge and skill level required to respond to the items. Teams of content experts reviewed items for potential issues of bias in favor of or against any demographic group of students, and for accessibility for students with disabilities and English language learners. Content, bias, and accessibility reviews were conducted prior to administration to any students. Following pilot and field test administrations, items were again reviewed if pilot or field test data indicated a potential problem. Finally, teachers participated in range finding and scoring of constructed-response items/tasks to ensure that the items/tasks could be properly scored given their scoring rubrics.

In this section, we will examine the primary role that educators played in creating the field-test item pool by writing, reviewing, and scoring items. This section will end by examining the current composition of the item pool.

## Item Writing

The Consortium worked with educators throughout the test development cycle to develop items. Prior to the spring 2013 pilot test, the Consortium engaged 136 educators in $\mathrm{K}-12$ and higher education from 19 member states to write items. Prior to the spring 2014 field test, 184 educators in K-12 and higher education from 16 member states participated in item writing. All K-12 participants:

- Were certified/licensed to teach ELA/literacy and/or mathematics in a K-12 public school;
- Were currently teaching in a public school within a Smarter Balanced Governing State;
- Had taught ELA/literacy and/or mathematics in grades 3 through 8 and/or high school within the past three years (second-grade teachers were also recruited to participate in the development of grade 3 items and/or tasks);
- Had previously reviewed part or all of the CCSS for the content area for which they were writing items and/or performance tasks;
- Submitted a statement of interest that described their interest in developing Smarter Balanced items and/or performance tasks as well as their qualifications for doing so;
- Completed training and achieved qualifications through the certification process.

Qualifications for Higher Education Faculty included:

- Current employment with, or recent retirement from, a college or university located within a Smarter Balanced Member State;
- Having taught developmental and/or entry-level courses in English, composition, mathematics, statistics or a related discipline within the last 3 years;
- Having previously reviewed part or all of the CCSS for the content area in which they are interested in writing items and/or performance tasks;
- Completing training and achieving qualifications through the certification process.

The selected educators were trained on the Consortium's content specifications, the item and task specifications, and ELA/literacy stimulus specifications, as well as the item authoring system in which the items were developed. In addition, professional item writers and the Consortium held regular meetings to provide direction and feedback to the educators. Educators, state partners, and assessment vendors developed the items in the Consortium's item pool.

## Training

Educators participated in a series of facilitated, online webinars in order to qualify as item writers. To facilitate participation, the Consortium scheduled multiple sessions in different time zones, including evening sessions. In addition to the facilitated sessions, the Consortium provided training modules that covered background on the Consortium, assessment design principles, and detailed information about item and performance task development. All modules were available in three formats: a

PowerPoint presentation with notes, a streaming presentation with narration that could be viewed online, and a downloadable audio/video presentation.

The item writers were specifically trained on the Consortium's content and item specifications, stimulus specifications, sensitivity and bias guidelines, and general accessibility guidelines. Training on these specifications and guidelines helped ensure that item writers were trained to write items that allowed the widest possible range of students to demonstrate their knowledge, skills, and cognitive processes with regard to the content. This meant that item writers needed to understand the content for which they were writing items as well as accessibility and sensitivity issues that might hinder students' ability to answer an item. Item writers were also trained to be aware of issues that might unintentionally bias an item for or against a particular group.

## Educator Participation

Consistent with the Consortium process, educators were the primary developers of items. The active involvement of educators was critical to the success of the item writing activities. Educators engage with students on a daily basis, and they understand the ways in which students can demonstrate their knowledge. Their involvement in item writing helped ensure that the assessment system is accurate and efficient, and provides valid evidence of student learning.

## State-Managed Item Development

The Consortium invited member states to participate in a separate effort to write items. This voluntary effort, known as State-Managed Item Development, was conducted to build the capacity of states to write items and to support the overall sustainability of the Consortium. To this end, six states (HI, ID, MI, WA, WV, and WY) participated in the state-managed field test item development opportunity. During this opportunity, educators within the six states developed approximately 3,100 items in mathematics and ELA/literacy across grades 3 through 8 and high school. These items were not operational in the Smarter Balanced 2015 summative assessments but were included as embedded field test items.

## Item Reviews

Once items were written, groups of educators reviewed items prior to their pilot test administration in spring 2013 and their field test administration in spring 2014. Items that met technical quality criteria from the pilot test were again reviewed prior to their use in the spring 2014 field test.

## Accessibility, Bias/Sensitivity, and Content Reviews

Panels of educators reviewed all items, performance tasks, and item stimuli for accessibility, bias/sensitivity, and content. Item stimuli refer to the reading passages used on the ELA/literacy assessments or the figures and graphics used on the mathematics assessments. Prior to the spring 2013 pilot test, 122 ELA/L educators and 106 mathematics educators reviewed items and performance tasks for accessibility, bias/sensitivity, or content, and 60 educators reviewed the ELA/L stimuli. Prior to the spring 2014 field test, 107 ELA/L educators and 157 mathematics educators from 14 states reviewed items and performance, and 95 educators from 13 states reviewed the ELA/L stimuli.

The educator qualifications for the accessibility, bias/sensitivity, and content reviews were the same as the educator qualifications for item writing except that participants were not required to submit a statement of interest. In addition, it was preferred (but not required) that educators have previous experience reviewing items, tasks, and/or stimuli.
During the accessibility reviews, panelists identified issues that may negatively affect a student's ability to access stimuli, items, or performance tasks, or to elicit valid evidence about an assessment target. During the bias and sensitivity review, panelists identified content in stimuli, items, or performance tasks that may negatively affect a student's ability to produce a correct response because of their background. The content review focused on developmental appropriateness and alignment of stimuli, items, and performance tasks to the content specifications and appropriate depths of knowledge. Panelists in the content review also checked the accuracy of the content, answer keys, and scoring materials. Items flagged for accessibility, bias/sensitivity, and/or content concerns were either revised to address the issues identified by the panelists or removed from the item pool.

Details about the item development process in ELA/literacy and mathematics are found in Appendix A. These are the steps each item goes through before it can be presented to students.

## Field Testing

When all of the developmental reviews had been conducted, items that passed data review became part of the 2014 Field Test. Details of the field test can be found in Chapters 7, 8 and 9 of the 2014 Technical Manual. Briefly, the field test was a comprehensive test that both established subject matter scales and provided item statistics and parameters.

## Item Scoring

For those items that could not be machine scored, the Consortium engaged 102 participants from 20 states in range finding activities for those items requiring human scoring following the spring 2013 pilot. After the spring 2014 field test, 104 educators participated in range finding. Range finding improves the consistency and validity of scoring for the assessment. During range finding, educators focused on the performance tasks for mathematics and ELA/literacy. The participants reviewed student responses against item rubrics, validated the rubrics' accuracy, and selected the anchor papers that would be used by scorers during operational scoring of test items. In mathematics, educators also reviewed constructed response items for grades 7, 8, and high school.
The educator qualifications for range finding were the same as the educator qualifications for item writing, except that participants were not required to submit a statement of interest. In addition, it was preferred (but not required) that educators had previous range finding experience.

To verify correct scoring for machine-scored items, a rubric validation activity was conducted. For multiple choice items, this is a simple key check. For other item types, such as grid interaction items (drag-and-drop), matching tables or equation entry, the procedure involves looking at a sample of student raw responses (screen coordinates or keystrokes) and assuring that the raw response was scored correctly. In the course of this process, reviewers may find unexpected responses that require adjustment of the scoring procedure to account for a wider response range. Item scoring software is then changed accordingly.

## Review of Item Data from Field Testing

The items developed for the 2015 operational item pool were administered during the spring 2014 field test, and data were analyzed to examine the statistical quality of the items. The Consortium established statistical criteria to flag items for possible defects in quality related to content, bias, or accessibility. Criteria that triggered item review are in Table 4.1. In addition, items with C-level of differential item functioning (DIF) were flagged for further review. (Details of DIF criteria can be found in Chapter 3 of this report.)

Following the spring 2014 field test, 57 ELA/literacy educators from 16 states and 30 mathematics educators from 12 states reviewed items with statistical flags, looking for possible content or bias issues. At least two educators reviewed each item. These educators were trained via webinars on the flagging criteria and on how to evaluate flagged items. Educators made recommendations on whether to accept the item with no change, revise and re-field test the item, or reject the item from the pool. McGraw-Hill CTB content experts reviewed all items where the reviewers' recommendations disagreed. In addition, McGraw-Hill CTB content experts and psychometricians also reviewed and provided recommendations for all items where both reviewers recommended accepting the item. In each situation, the content expert provided the Consortium with a final recommendation for the item.

The educator qualifications for the item data reviews were the same as the educator qualifications for item writing except that participants were not required to submit a statement of interest.

Table 4.2 Item FLAGGING BASED ON CLASSICAL STATISTICS AND JUDGEMENTAL REVIEW

| Flag | Definition |
| :--- | :--- |
| A | High difficulty (p-value less than 0.10) |
| B | Polytomous items with percentage obtaining any score category less than three percent of total N |
| C | Polytomous items with higher criterion score mean for students in a lower score-point category |
| D | Selected response items with proportionally more high-proficient students selecting a distractor <br> over the key |
| F | Selected response items with higher criterion score mean for students choosing a distractor than <br> the mean for those choosing the key |
| H | Low difficulty (p-value greater than 0.95) |
| P | Selected response items with positive distractor point-biserial correlation |
| R | Low item-total correlation (p-value less than 0.30) |
| V | Item more difficult at the higher-grade level for vertical linking items |
| Z | Item needs content review (judgmental decision) |

Items with no statistical flags were eligible for use in the operational pools. Flagged items moved into operational pools if they were not rejected or revised in data review. Not all operational items were used in summative test pools. Some items were used in achievement levels setting. Those and additional items were used for the interim assessments. Table 4.3 shows how summative pools were derived from the original field test pool.

TABLE 4.3 DISPENSATION OF FIELD TEST ITEMS

| Content Area | Grade | Initial <br> Field Test Pool | Reason for Pool Removal |  |  |  | Summative Pool |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Content Issues | Small Sample Size | Poor Item Statistics | Interim/ Other uses |  |
| English Language Arts | 3 | 1,045 | 30 | 31 | 88 | 242 | 654 |
|  | 4 | 965 | 17 | 32 | 60 | 203 | 653 |
|  | 5 | 975 | 23 | 45 | 84 | 178 | 645 |
|  | 6 | 984 | 23 | 30 | 82 | 236 | 613 |
|  | 7 | 1,033 | 27 | 31 | 100 | 286 | 589 |
|  | 8 | 1,010 | 20 | 40 | 114 | 242 | 594 |
|  | HS | 3,371 | 61 | 658 | 281 | 809 | 1,562 |
|  | Total | 9383 | 201 | 867 | 809 | 2196 | 5310 |
| Mathematics | 3 | 1,163 | 1 | 0 | 48 | 157 | 957 |

|  | 6 | 1115 | 8 | 0 | 89 | 164 | 854 |
|  | 7 | 1,037 | 5 | 0 | 90 | 175 | 767 |
|  | 8 | 1,036 | 9 | 0 | 133 | 159 | 735 |
|  | HS | 3,386 | 75 | 797 | 488 | 156 | 1,870 |
|  | Total | 10052 | 109 | 797 | 979 | 1139 | 7028 |

## Composition of Summative Item Pools

The numbers of items in each summative content area, grade and claim are shown in Table 4.4.

| CLAIMS |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| GRADE | 1 | 2 | 3 | 4 | Total |
| ELA/Literacy |  |  |  |  |  |
| 3 | 217 | 194 | 118 | 125 | 654 |
| 4 | 177 | 205 | 127 | 144 | 653 |
| 5 | 194 | 201 | 108 | 142 | 645 |
| 6 | 175 | 199 | 116 | 123 | 613 |
| 7 | 183 | 194 | 117 | 95 | 589 |
| 8 | 161 | 190 | 131 | 112 | 594 |
| 11 | 499 | 429 | 334 | 300 | 1562 |
| Total | 1606 | 1612 | 1051 | 1041 | 5310 |
| Mathematics |  |  |  |  |  |
| 3 | 551 | 130 | 160 | 116 | 957 |
| 4 | 525 | 131 | 149 | 127 | 932 |
| 5 | 462 | 117 | 182 | 152 | 913 |
| 6 | 519 | 107 | 137 | 91 | 854 |
| 7 | 452 | 100 | 125 | 90 | 767 |
| 8 | 425 | 81 | 142 | 87 | 735 |
| 11 | 1022 | 196 | 460 | 192 | 1870 |
| Total | 3956 | 862 | 1355 | 855 | 7028 |

The Consortium developed many different types of items beyond the traditional multiple-choice item. This was done to measure claims and assessment targets with varying degrees of complexity by allowing students to respond in a variety of ways rather than simply recognizing a correct response. These different item types are listed in Table 4.5. Distribution of item types is shown in Table 4.6 and Table 4.7. Note that each Essay written is associated with two items. Essays are scored on three traits, two of which are combined, resulting in two items for each essay.

TABLE 4.5 ITEM TYPES FOUND IN THE SUMMATIVE ITEM POOLS

| Item Types | ELA/literacy | Mathematics |
| :--- | :---: | :---: |
| Multiple Choice (MC) | X | X |
| Multiple Select (MS) | X | X |
| Evidence-Based Selected Response (EBSR) | X |  |
| Match Interaction (MI) | X | X |
| Hot Text (HTQ) | X | X |
| Short Answer Text Response (SA) | X |  |
| Essay/Writing Extended Response (WER) | X |  |
| Equation Response (EQ) |  | X |
| Grid Item Response (GI) |  | X |
| Table Interaction (TI) |  |  |

Each grade's item pool for the Consortium's test was large enough to support the summative blueprint. Unlike a traditional paper-and-pencil test where all students take the same items, students taking the Consortium's CAT take items and tasks targeted to their ability level. This means that the Consortium needed to develop a very large number of items in order to meet the needs of the student population.

In addition to the items for the CAT, the Consortium also developed performance tasks. All students take performance tasks designed to measure a student's ability to integrate knowledge and skills across multiple claims and assessment targets. Each ELA/literacy performance task has a set of related stimuli presented with two or three research items and an essay. Each Mathematics performance task has 4 to 6 items relating to a central problem or stimulus.

Table 4.8 Number of performance tasks by grade

| Grade | ELA | Math |
| :---: | :---: | :---: |
| 3 | 14 | 18 |
| 4 | 19 | 19 |
| 5 | 20 | 15 |
| 6 | 14 | 18 |
| 7 | 19 | 16 |
| 8 | 21 | 18 |
| 11 | 24 | 17 |

The distribution of item parameters by grade and claim are shown below. Note that there is a wide range of difficulty in each category. This enables the algorithm (described previously in this chapter) to find the best items for each student. As such, adaptive tests provide more precise measurement for all levels of student performance than would be provided with a fixed form test of the same length. This is accomplished through having a bank of previously calibrated items to deliver during the adaptive portion of the test. In addition, fixed randomly assigned performance tasks add information to student performance.

## Content Alignment

In developing a system of assessments, Smarter Balanced is committed to ensuring that its measurement reflects the expectations of content, rigor, and performance that correspond to the CCSS. To that end, Smarter Balanced designed item specifications to demonstrate alignment through methodologies that reflect ECD theory. According to Webb (2002), "Alignment of expectations for student learning and assessments for measuring students' attainment of these expectations is an essential attribute for an effective standards-based education system." DeMauro (2004) states, "Alignment activities . . . should be the guiding principle of test design, and item alignment studies should be sources of validity documentation, as should any studies of test content." Test content alignment is at the core of content validity and consequential validity (Martone \& Sireci, 2009). Content alignment addresses the appropriateness of inferences drawn from test results concerning "how well all policy elements [e.g., expectations and assessments] guide instruction and, ultimately, impact student learning" (Webb, 1997). Since Consortium states have adopted the CCSS in ELA/literacy and mathematics, it was imperative that Smarter Balanced conduct the appropriate alignment studies. Accordingly, the Consortium contracted with the Human Resources Research Organization to conduct an alignment study (HumRRO, 2014).

Webb (1997) identified several categories of criteria for judging content alignment. The Smarter Balanced alignment study describes how well the Smarter Balanced tests address expectations embodied in the Smarter Balanced content specifications and the CCSS. Test content alignment is at the core of content validity and consequential validity (Martone and Sireci, 2009). Because of the high stakes associated with statewide testing and the need to communicate learning goals during the NCLB era, attention was directed at test alignment in addition to individual item alignment. The emphasis on test content in alignment and validity studies is understandable. After all, a test is a small sampling of items from a much larger universe of possible items/tasks representing a very broad domain. For inferences from test results to be justifiable, that sample of items has to be an adequate representation of the broad domain, providing strong evidence to support claims based on the test results.

Assessment is always constrained to some extent by time and resources. Items and tasks that require extensive time (performance tasks and text responses), items that require expensive scoring, and items that require a lot of computer bandwidth (videos, animations) must be limited and chosen carefully. Smarter Balanced content experts carefully scrutinized each blueprint to assure optimal content coverage and prudent use of time and resources. In general, the Smarter Balanced blueprints represent content sampling proportions that reflect intended emphasis in instruction and mastery at each grade level. Specifications for numbers of items by claim, assessment target, depth-of-knowledge, and item type demonstrate the desired proportions within test delivery constraints. The blueprints were subject to state approval through a formal vote.

The alignment study conducted for the Consortium (HumRRO, 2014) discusses alignment among elements of content standards, content specifications, item specifications, and blueprints. The study itself is extensive, but its overall finding is that the Smarter Balanced summative tests and supporting item pools exceed levels of DOK representation recommended by Webb. The analysis is done with test blueprint, item and test specifications and item pools.

## Fordham/HumRRO study

Extensive alignment studies were conducted in grades 5 and 8 by the Thomas B. Fordham Institute (Doorey \& Polikoff, 2016) and in high school by the Human Resources Research Organization (HumRRO) (Schultz, Michaels, Dvorak, \& Wiley 2016). Their evaluation was based on elements of the Criteria for Procuring and Evaluating High Quality Assessments developed by the Council of Chief State School Officers (CCSSO) and released in 2014. The study involved looking at items from simulated test events to evaluate operation of the test as experienced by students. Reviewers felt that the items were adequately aligned in almost all aspects, with many excellent ratings. Reviewers commented on the quality of the tasks with regard to the types of skills required for college and career readiness. Results of the study are shown below.

## ELA/LITERACY Ratings: 3-8 HS

## I. CONTENT: Assesses the content most needed for College and Career Readiness

B. 3 Reading1: Tests require students to read closely and use specific evidence from texts to obtain and defend correct responses.
B. 5 Writing1: Tasks require students to engage in close reading and analysis of texts. Across each grade band, tests include a balance of expository, persuasive/argument, and narrative writing.
B. 6 Vocabulary and language skills: Tests place sufficient emphasis on academic vocabulary and language conventions as used in real-world activities.
B. 7 Research and inquiry: Assessments require students to demonstrate the ability to find, process, synthesize, and organize information from multiple sources.
B. 8 Speaking and listening: Over time, and as assessment advances allow, the assessments measure speaking and listening communication skills.

## II. DEPTH: Assesses depth that reflects the demands of College and Career Readiness

B. 1 Text quality and types1: Tests include an aligned balance of highquality literary and informational texts.
B. 2 Complexity of texts1, 3: Test passages are at appropriate levels of text complexity, increasing through the grades, and multiple forms of authentic, high-quality texts are used.
B. 4 Cognitive demand: The distribution of cognitive demand for each grade level is sufficient to assess the depth and complexity of the standards.
B. 9 High-quality items and variety of item types: Items are of high technical Good Excellent and editorial quality and test forms include at least two item types with at least one that requires students to generate a response.

## Excellent <br> Excellent

Excellent Excellent

Excellent Excellent

Good Excellent

Good

Excellent Excellent

Good Good

Good Excellent

In ELA/literacy, reviewers gave a limited/uneven match rating for B. 8 because Smarter Balanced tests assess only listening and not speaking at this time.

| MATHEMATICS | 3-8 | HS |
| :---: | :---: | :---: |
| I. CONTENT: Assesses the content most needed for College and Career Readiness | Good | Excellent |
| C. 1 Focus 1: Tests focus strongly on the content most needed in each grade or course for success in later mathematics (i.e., major work). | Good | Excellent |
| C. 2 Concepts, procedures, and applications: Assessments place balanced emphasis on the measurement of conceptual understanding, fluency and procedural skill, and the application of mathematics. | N/A | Good |
| II. DEPTH: Assesses the depth that reflects the demands of College and Career Readiness | Good | Excellent |
| C. 3 Connecting practice to content1, 5: Test questions meaningfully connect mathematical practices and processes with mathematical content. | Excellent | Excellent |
| C. 4 Cognitive demand: The distribution of cognitive demand for each grade level is sufficient to assess the depth and complexity of the standards. | Good | Excellent |
| C. 5 High-quality items and variety of item types: Items are of high technical and editorial quality and test forms include at least two item types, at least one that requires students to generate a response. | Limited/ Uneven | Good |

Math C. 5 received a limited/uneven match rating in grades 3-8 because reviewers encountered a few items with minor editorial issues. This has prompted an editorial review of the existing items.

## Pool analysis and adequacy: Background and Recommendations

The quality of a CAT is highly dependent on the quality of the item pool. Quality is primarily related to how well the content constraints and statistical criteria can be met. The content specifications are defined as a combination of item attributes that tests delivered to students should have. There are typically constraints on item content such that they must conform to coverage of a test blueprint. If there are many content constraints and a limited pool, then it will be difficult to meet the CAT specifications. For a given content target, if the available difficulty/item information targeted at a given level ability is not available, then estimation error cannot be reduced efficiently. A third dimension is that there is usually some need to monitor the exposure of items such that the "best" items are not administered at high rates relative to other ones. Therefore, the quality of the item pools is critical to achieving the benefits that accrue for the CAT over fixed test forms. Quantification of pool adequacy prior to simulation could be accomplished either through the Reckase (2003) "bin" method or the van der Linden (2005) "shadow test" method. Both involve an inventory of items by required blueprint elements and information ranges. Smarter Balanced used the Reckase "bin" method to evaluate the pool and provide information for new item development. In general, the proportions of items in the pool were written to reflect test blueprints. Although item developers
strove to develop items covering the range of examinee achievement levels, the item pool is relatively difficult as compared to the performance that students displayed on the tests.

[^5]
## Summary of Test Design

The intent of this chapter is to show how the assessment design supports the purposes of Smarter Balanced summative assessments. Content specifications were derived directly from the CCSS, expressing the standards as measurable elements and made explicit in Smarter Balanced claims and assessment targets structure. Building on these, test blueprints provide appropriate proportions of CCSS content coverage. Using the blueprints, item writers wrote items and tasks in quantities that supported CAT and performance task delivery. Expansion of item and task types promoted student responses that provide more insight into proficiency than that provided by multiple choice items alone. The use of performance tasks addresses the need to assess application and integration of skills. Finally, the method of delivery and test scoring, combining adaptive and non-adaptive elements, provides the most precise information and an enhanced student testing experience.

## Chapter 5: Scores, Scales and Norms

## Introduction

A test score is provided to stakeholders as a metric of student performance on a test. On the Smarter Balanced assessments, this test score along with the achievement level descriptors help students understand their progress towards career and college readiness. This chapter summarizes the processes that Smarter Balanced undertook to construct a psychometrically-sound test scale so that stakeholders would receive meaningful test scores. This chapter begins with an overview of the work done in the pilot and field tests to select a psychometric model, to construct the Smarter Balanced test scale, and to establish cut scores. Normative information from the 2015 operational administration is shared at the end of the chapter.

## Item Response Theory

Unidimensional Item Response Theory (IRT) models were used to calibrate items and create Smarter Balanced test scale. The specific models were chosen following studies completed during the pilot and field test phases of the assessment. Table 5.1 summarizes the analyses completed during the pilot and field test phases that are related to calibration and scaling.

Table 5.1. ANALYSES COMPLETED DURING PILOT AND FIELD TEST TO SELECT CALIBRATION AND SCALING MODEL ${ }^{7}$

| Phase | Analysis | Summary |
| :---: | :---: | :---: |
| Pilot | Dimensionality | Multidimensional IRT was used as a factor analytic approach to examine the dimensional structure of the assessments. This purpose of the study was to examine 1) the degree to which essential unidimensionality is met within a single grade and content area, and 2) the degree of invariance in the construct across two adjacent grades that contain unique grade specific items and common "vertical" linking items. Based on the results of the study, it was concluded that the data support the use of a unidimensional IRT model and a vertical scale. |
|  | IRT Model Choice | Various unidimensional models were investigated: a Rasch oneparameter/partial credit model (Rasch/PC) combination; a twoparameter logistic/generalized partial credit model (2PL/GPC) combination; or a three-parameter logistic/generalized partial credit (3PL/GPC) combination. The choice of model was based on model simplicity, model fit, model stability, and reasonableness. Special investigations of guessing and discrimination were completed. In addition, the ability estimates were compared across the three models. Based on the results of the studies and the considerations outline above, Smarter Balanced chose to employ the 2PL/GPC model. |

[^6]| Phase | Analysis | Summary |
| :--- | :--- | :--- |
| Field Test | Application of IRT Model | The IRT models selected during the pilot test phase were used for <br> calibrating the items in the field test phase. The usefulness of IRT <br> models is dependent on the extent to which they effectively reflect the <br> data. Assessing fit in item response models usually involves validating <br> assumptions underlying the models and evaluating goodness-of-fit, <br> which specifically refers to how effectively the model describes the <br> outcome data. IRT fit evaluation was conducted for calibrations using <br> the 2PL/GPC combination. Item fit was evaluated in conjunction with <br> other psychometric criteria and the plots described previously. No items <br> were excluded based solely on fit. The results of the evaluation <br> supported the use of the 2PL/GPC model. |
| Final Scale | Scaling for the vertical scaling sample was completed in two steps, one <br> linking tests horizontally within a grade level and content area, and a <br> second linking tests vertically to adjacent grade levels within the <br> content area. Following scaling of the vertical scaling sample, the <br> remainder of the item pool was calibrated The horizontal scale was <br> created using a hybrid approach using both common items and <br> randomly equivalent groups (implemented using LOFT administration). <br> Items were calibrated using the IRT program PARSCALE. Consistent <br> with the CCSS articulation of content through the grade levels, Smarter <br> Balanced constructed a vertical scale to illustrate the amount of <br> change that occurs in student learning from one grade level to the next. <br> To create the scale, Smarter Balanced first evaluated the horizontal <br> scaling of items in the targeted item pool. Once horizontal scaling was <br> completed, vertical scaling was completed using common items. <br> Smarter Balanced selected test characteristic curve transformation <br> methods to construct the vertical scale, using grade 6 as the baseline <br> and successively linking each grade level onto the scale. After <br> completion of the vertical scale for the targeted item pool, the <br> remaining items were linked onto the scale for each content area using <br> the STUIRT software program. |  |

## Calibration and Scaling

Smarter Balanced utilizes the two-parameter logistic (2PL) model and the generalized partial credit model (GPCM) to calibrate selected-response and polytomous items, respectively. The 2PL model (Birnbaum, 1968) is given by

$$
P_{i}\left(\theta_{j}\right)=\frac{\exp \left[D a_{i}\left(\theta_{j}-b_{i}\right)\right]}{\left\{1+\exp \left[D a_{i}\left(\theta_{j}-b_{i}\right)\right]\right\}},
$$

where $P_{i}\left(\theta_{j}\right)$ is the probability of a correct response to item $i$ by a test taker with ability $\theta_{j}$; $a_{i}$ is the discrimination parameter; $b_{i}$ is the difficulty parameter for item $i$; and $D$ is a constant that puts the ability scale into the same metric as the normal ogive model ( $D=1.7$ ).

For constructed-response items, the generalized partial credit model (GPCM; Muraki, 1992) or partial credit model (PCM; Masters, 1982) is employed. The generalized partial credit model is given by

$$
P_{i h}\left(\theta_{j}\right)=\frac{\exp \sum_{v=1}^{h}\left[D a_{i}\left(\theta_{j}-b_{i}+d_{i v}\right)\right]}{\sum_{c=1}^{n_{i}} \exp \left[\Sigma_{v=1}^{c} D a_{i}\left(\theta_{j}-b_{i}+d_{i v}\right)\right]},
$$

where $P_{i h}\left(\theta_{j}\right)$ is the probability of examinee $j$ obtaining a score of $h$ on item $i ; n_{i}$ is the number of item score categories; $b_{i}$ is the item location parameter; $d_{i v}$ is the category parameter for item $i$, category v ; and $D$ is a scaling constant given previously.

PARSCALE (Muraki \& Bock, 2003) was used for the IRT calibrations. PARSCALE is a multipurpose program that implements a variety of IRT models associated with mixed-item formats and associated statistics. The psychometric properties of PARSCALE are well known, and it can efficiently and accurately calibrate large data sets such as those of Smarter Balanced assessments. The program implements marginal maximum likelihood (MML) estimation techniques for items and MLE estimation of theta.

## Vertical Scale

The IRT scaling for Smarter Balanced was performed in two steps. The first step was used to establish the horizontal and vertical scales that were used to set achievement levels. In the first step, items were initially scaled horizontally, where items in a single grade and content area were concurrently (i.e., simultaneously) calibrated. The vertical linking was accomplished using common items administered across grades (e.g., the same items given in 3rd and 4th grades) and then placing consecutive grades onto the vertical scale. In the second horizontal calibration step, the remaining, and much larger, item pool (containing non-common items, each administered only to one grade) was scaled using the items from the first phase as linking/common items. For detailed description of the methods used in vertical scaling, see Chapter 9 of the 2013-2014 Technical Report (Smarter Balanced, 2016).

## Transforming the Theta Metric to the Scale Score

The results from the calibration are in a theta metric. These results are transformed onto a four-digit scale that is more meaningful for stakeholders. The equation for this transformation is:

$$
\text { Scale score = (logit * slope) }+ \text { intercept }
$$

Table 5.2 shows the slope and intercept for ELA/literacy and mathematics.
Table 5.2. Slope and Intercept for ELA/Literacy and Mathematics

| Subject | Grade | Slope | Intercept |
| :---: | :---: | :---: | :---: |
|  |  |  |  |
| ELA/literacy | $3-8$, HS | 85.8 | 2508.2 |
| Mathematics | $3-8$, HS | 79.3 | 2514.9 |

## Minimum and Maximum Scale Scores

A maximum likelihood procedure will not result in theta estimates for students with perfect or zero scores. Scale scores can be established for these extreme values following a non-maximum likelihood but logical procedure. These minimum and maximum values are called the Lowest Obtainable Scale Score (LOSS) and the Highest Obtainable Scale Score (HOSS). The guidelines for establishing the LOSS and HOSS values were as follows.

1. The HOSS should be high enough so that it does not cause a disproportionate number of scale scores at the top of the scale. Likewise, the LOSS should be low enough so that it does not cause a disproportionate number of scale scores at the bottom part of the scale.
2. The HOSS should be low enough so that CSEM(HOSS) < 10*Minimum(CSEMs for all scale scores), where CSEM is the conditional standard error of measurement. The LOSS should be high enough so that CSEM(LOSS)<15*Minimum(CSEMs for all scale scores).
3. For multiple test levels placed on the same vertical scale, the HOSS and LOSS values should increase and transition smoothly over levels.

Table 5.3 provides the Smarter Balanced LOSS and HOSS values. The LOSS and HOSS values give the effective range of the ELA/literacy and mathematics scales. The ELA/literacy scale ranges from a value of 2114 , which is the LOSS for grade 3 , to the HOSS of 2795 for high school. In mathematics, the range was from 2189 to 2862.

Table 5.3. Lowest Obtainable Scale Scores (LOSS) and Highest Obtainable Scale Scores (HOSS) by Grade and Content Area

| Grade | LOSS | CSEM | HOSS | CSEM |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| ELA/literacy |  |  |  |  |  |
| 3 | 2114 | 2613 | 2623 | 2538 |  |
| 4 | 2131 | 2611 | 2663 | 2554 |  |
| 5 | 2201 | 2597 | 2701 | 2548 |  |
| 6 | 2210 | 2603 | 2724 | 2543 |  |
| 7 | 2258 | 2580 | 2745 | 2545 |  |
| 8 | 2288 | 2601 | 2769 | 2538 |  |
| HS | 2299 | 2594 | 2795 | 2549 |  |
| Mathematics |  |  |  |  |  |
| 3 | 2189 | 2594 | 2621 | 2550 |  |
| 4 | 2204 | 2574 | 2659 | 2552 |  |
| 5 | 2219 | 2628 | 2700 | 2542 |  |
| 6 | 2235 | 2684 | 2748 | 2567 |  |
| 7 | 2250 | 2710 | 2778 | 2559 |  |
| 8 | 2265 | 2677 | 2802 | 2569 |  |
| HS | 2280 | 2675 | 2862 | 2566 |  |

## Achievement-Level Setting

The Consortium used a multi-step process, called achievement level setting also known as standard setting, to establish the cut scores that separate students into achievement levels in ELA/literacy and mathematics across grades 3 through 8 and 11 (Smarter Balanced, 2015a).

## Pre-Step: Development of the Achievement Level Descriptors

Smarter Balanced developed an interconnected system of achievement level descriptors (ALDs) for English language arts/literacy (ELA/literacy) and mathematics (CTB/McGraw Hill, 2014). These ALDs were developed through a series of workshops and review cycles that allowed participation from a variety of Smarter Balanced stakeholders. Key to the achievement level setting process, Smarter Balanced established Threshold ALDs that aligned to the Smarter Balanced content specifications and the Common Core State Standards that represent the knowledge and skills of a student at the borderline of a given achievement level. These Threshold ALDs provided panelists with a detailed description of the expectations of the students just entering each achievement level. The Threshold ALDs are important, because they ultimately guided the work of the achievement level setting process.

## Step 1: Distributed Standard Setting (Online Panel)

Smarter Balanced selected the bookmark standard setting procedure (Lewis, Mitzel, Mercado, \& Schultz, 2012) to set achievement levels because it is appropriate for assessments with a mixture of item types. The Smarter Balanced assessments are calibrated and scaled using item-response theory models, and the bookmark procedure utilizes those same models to create the item maps that underlie the procedure. The psychometric foundation of the bookmark procedure is well documented (e.g., Cizek \& Bunch, 2007), and its usefulness has been well established through adoption of cut scores produced by bookmark-based standard-setting activities.

The bookmark method relies on presenting panelists with sets of test items sorted by difficulty and representing test content, called an ordered item booklet (OIB). The OIBs were constructed to match Smarter Balanced guidelines with respect to targets and claims used to inform item and test development. In addition, some of the items in the OIBs for grades 4,8 , and 11 were from other tests such as the National Assessment of Educational Progress (NAEP) and the Programme for International Student Assessment (PISA). These items were embedded in the spring 2014 field test to provide panelists with an external reference range for comparison to the performance of students on other tests.

In order to maximize participation, the Consortium invited educators, parents, and other concerned citizens from member states to participate in an online achievement level setting using the bookmark standard setting procedure. During the online session, thousands of teachers and other interested parties independently reviewed test questions and recommended the level of performance required for students to be considered on-track toward college and career readiness. In other words, the online panel only made recommendations in regard to Level 3.

The concept of an online panel is an innovation introduced to address the scale of the Smarter Balanced project and its number and variety of stakeholders. In addition to allowing wider achievement level setting participation, the online panel approach promotes deeper understanding of the content standards and Smarter Balanced assessments. The cut score recommended by the online panels were presented during the in-person workshop.

## Step 2: In-Person Panel

The in-person panel allowed teams of educators and other stakeholders nominated by member states to deliberate and recommend cut scores for all four achievement levels: Level 1, Level 2, Level 3, and Level 4. The in-person panel engaged in the bookmark standard setting procedure using the same ordered item booklets (OIBs) reviewed by the online panel. Separate grade-level panels for each content area, consisting of approximately 30 members each, were convened to recommend cut scores for ELA/literacy and mathematics. Member states nominated all panelists, which included teachers and administrators, higher education faculty, business and community leaders, and parents

The in-person panels participated in three rounds of discussion and bookmark placements. In Round 1, panelists studied the items in the OIB and made recommendations. In Round 2, panelists were shown the cut scores from the online standard setting, engaged in small group discussions, and made recommendations. In Round 3, panelists were shown various forms of impact data (percentage of students in each achievement level), engaged in large group discussions, and made recommendations

For the in-person achievement level setting, the process was field tested and revised based on field test evidence. In addition, panelists were asked to provide feedback on their experience with the activities used to set cut scores. The vast majority of panelists (over 90\%) agreed that the activities of the workshop (e.g., training and practice exercises, taking the practice test, engaging in discussions) were useful to their understanding of the process.

## Step 3: Cross-Grade Review (Vertical Articulation Committee)

Following the in-person achievement level setting, a subset consisting primarily of educators from the in-person panels met to review the achievement levels recommended during the in-person achievement level setting (Step 2). Separate cross-grade panels were convened for ELA/literacy and for mathematics. The purpose of the cross-grade review was to ensure that the achievement levels were appropriately aligned across grades and would accurately reflect student progress from year to year. The panelists at the cross-grade review examined the earlier recommendations and suggested changes that would improve cross-grade alignment of the achievement level. For the vertical articulation panel, the process was field tested and revised based on field test evidence.

## Step 4: Member Approval

The final recommendations were reviewed, adjusted, and then endorsed by the member states. Member states were not required to adopt the achievement levels. Higher education leaders participated in the decisions regarding grade 11 achievement levels to ensure they reflect the expectations of colleges and universities. The Consortium's Technical Advisory Committee, a special advisory committee on achievement level setting, and an expert auditor (Dr. Gregory Cizek, a nationally-recognized expert in achievement level setting) certified that the multi-step process was appropriately implemented. The achievement levels were then subject to existing approval processes within individual states and territories. The final cut scores are reported in Table 5.4.

Table 5.4. Cut Scores for English Language Arts/Literacy and Mathematics

|  | Grade | SS Cut between Levels 1 and 2 | SS Cut between Levels 2 and 3 | SS Cut between Levels 3 and 4 |
| :---: | :---: | :---: | :---: | :---: |
| ELA | 3 | 2367 | 2432 | 2490 |
|  | 4 | 2416 | 2473 | 2533 |
|  | 5 | 2442 | 2502 | 2582 |
|  | 6 | 2457 | 2531 | 2618 |
|  | 7 | 2479 | 2552 | 2649 |
|  | 8 | 2487 | 2567 | 2668 |
|  | HS | 2493 | 2583 | 2682 |
| Math | 3 | 2381 | 2436 | 2501 |
|  | 4 | 2411 | 2485 | 2549 |
|  | 5 | 2455 | 2528 | 2579 |
|  | 6 | 2473 | 2552 | 2610 |
|  | 7 | 2484 | 2567 | 2635 |
|  | 8 | 2504 | 2586 | 2653 |
|  | HS | 2543 | 2628 | 2718 |

## Results for the 2014-2015 Assessments

Results presented below are data aggregated across the Smarter Balanced members that submitted de-identified student results data for the 2014-2015 assessment ${ }^{8}$. The results in the tables in this chapter presented as evidence of reliability and validity of the scores from the Smarter Balanced assessments and should not be used for accountability purposes.

## Overall Results

Student results are reported in two primary ways: scale scores and achievement levels. Students are provided with results for the overall test and for the assessment claims. The scale score quantifies student achievement, and the achievement-levels plainly define the meaning of the scores to stakeholders. Together, scale scores and achievement levels provide a comprehensive set of tools to assess student achievement by content and grade level. Table 5.5 provides the claims associated with the overall level for each content area.

[^7]Table 5.5. Smarter Balanced Overall Assessment Claims

|  | ELA/Literacy | Mathematics |
| :--- | :--- | :--- |
| Overall, Grades 3-8 | Students can demonstrate <br> progress toward college and <br> career readiness in English <br> language arts and literacy. | Students can demonstrate <br> progress toward college and <br> career readiness in <br> mathematics. |
| Overall, Grade 11 | Students can demonstrate <br> college and career readiness in <br> English language arts and <br> literacy. | Students can demonstrate <br> college and career readiness in <br> mathematics. |

Table 5.6 through Table 5.19 presents aggregate student results for the average overall scale score and for the percentage of students in each achievement level. These results are presented at the aggregate level (all submitted Consortium data) and disaggregated by gender, by race/ethnicity, and by various status flags: limited English proficiency, IDEA indicator, Section 504, and economically disadvantaged.

Table 5.6. Grade 3 ELA/literacy Average Overall Scale Score and Percentage in Each Achievement Level by Selected Demographic Groups, 2014-2015 Administration

| Group | Scale Scores |  |  |  | Achievement Levels |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | N | M | SD | 1 | 2 | 3 | 4 | 3 \& 4 |
| Total | 776842 | 2412.9 | 87.1 | 31.5\% | 26.2\% | 21.7\% | 20.6\% | 42.3\% |
| Female | 379753 | 2422.9 | 86.2 | 27.2\% | 26.2\% | 23.1\% | 23.6\% | 46.7\% |

## Claim-Level Results

Students also received achievement level assignments at the claim level. The content-specific claim scores are computed in relationship to the Level 3 cut score, and reported as Above Standard, At/Near Standard, or Below Standard.

- Table 5.20 presents each Smarter Balanced assessment claim.
- Table 5.21 through Table 5.27 presents aggregate student results for the ELA/literacy Claim 1 average scale score and for the percentage of students in each reporting category for grades 3 through 8 and 11.
- Table 5.28 through Table 5.34 presents aggregate student results for the ELA/literacy Claim 2 average scale score and for the percentage of students in each reporting category for grades 3 through 8 and 11.
- Table 5.35 through Table 5.41 presents aggregate student results for the ELA/literacy Claim 3 average scale score and for the percentage of students in each reporting category for grades 3 through 8 and 11.
- Table 5.42 through Table 5.48 presents aggregate student results for the ELA/literacy Claim 4 average scale score and for the percentage of students in each reporting category for grades 3 through 8 and 11.
- Table 5.49 through Table 5.55 presents aggregate student results for the Mathematics Claim 1 average scale score and for the percentage of students in each reporting category for grades 3 through 8 and 11.
- Table 5.56 through Table 5.62 presents aggregate student results for the Mathematics Claim 2/4 average scale score and for the percentage of students in each reporting category for grades 3 through 8 and 11.
- Table 5.63 through Table 5.69 presents aggregate student results for the Mathematics Claim 3 average scale score and for the percentage of students in each reporting category for grades 3 through 8 and 11.

These results are presented at the aggregate level (all submitted Consortium data) and disaggregated by gender, by race/ethnicity, and by various status flags: limited English proficiency, IDEA indicator, Section 504, and economically disadvantaged.

Table 5.20. Smarter Balanced Assessment Claims

|  | ELA/ Literacy | Mathematics |
| :--- | :--- | :--- |
| Claim 1 | Reading: Students can read closely <br> and analytically to comprehend a <br> range of increasingly complex <br> literary and informational texts. | Concepts \& Procedures: Students <br> can explain and apply <br> mathematics concepts and <br> interpret and carry out <br> mathematics procedures with <br> precision and fluency. |
| Claim 2 | Writing: Students can produce <br> effective and well-grounded writing <br> for a range of purposes and <br> audiences. | Problem Solving:* Students can <br> solve a range of complex well- <br> posed problems in pure and <br> applied mathematics, making <br> productive use of knowledge and <br> problem solving strategies. |
| Claim 3 | Speaking and Listening: Students <br> can employ effective speaking and <br> listening skills for a range of <br> purposes and audiences. | Communicating Reasoning: <br> Students can clearly and precisely <br> construct viable arguments to <br> support their own reasoning and <br> to critique the reasoning of others. |
| Claim 4 | Research/Inquiry: Students can <br> engage in research and inquiry to <br> investigate topics, and to analyze, <br> integrate, and present information. | Modeling and Data Analysis:* <br> Students can analyze complex, <br> real-world scenarios and can <br> construct and use mathematical <br> models to interpret and solve <br> problems. |

*Claims 2 and 4 in mathematics are reported jointly

## Percentile Tables for Overall Scale Scores

Table 5.70 through Table 5.76 present the overall ELA/literacy scale score for the $10^{\text {th }}, 20^{\text {th }}, 30^{\text {th }}$, $40^{\text {th }}, 50^{\text {th }}, 60^{\text {th }}, 70^{\text {th }}, 80^{\text {th }}$, and $90^{\text {th }}$ for grades 3 through 8 and 11 . Table 5.77 through Table 5.83 present the decile information for the overall mathematics scale scores for grades 3 through 8 and 11. These results are presented at the aggregate level and disaggregated by gender, by race/ethnicity, and by various status flags: limited English proficiency, IDEA indicator, Section 504, and economically disadvantaged.

## Percentile Tables for Claim-level Scale Scores

- Table 5.84 through Table 5.90 present the decile information for the Claim 1 ELA/literacy scale scores for grades 3 through 8 and 11.
- Table 5.91 through Table 5.97 present the decile information for the Claim 2 ELA/literacy scale scores for grades 3 through 8 and 11.
- Table 5.98 through Table 5.104 present the decile information for the Claim 3 ELA/literacy scale scores for grades 3 through 8 and 11.
- Table 5.105 through Table 5.111 present the decile information for the Claim 4 ELA/literacy scale scores for grades 3 through 8 and 11.
- Table 5.112 through Table 5.118 present the decile information for the Claim 1 mathematics scale scores for grades 3 through 8 and 11.
- Table 5.119 through Table 5.125 present the decile information for the Claim 2/4 mathematics scale scores for grades 3 through 8 and 11.
- Table 5.126 through Table 5.132 present the decile information for the Claim 3 mathematics scale scores for grades 3 through 8 and 11.

## Modes of Administration

Table 5.133 through Table 5.146 present counts of summative assessment administrations by mode ${ }^{9}$. These counts are presented at the aggregate level and disaggregated by gender, by race/ethnicity, and by various status flags: limited English proficiency, IDEA indicator, Section 504, and economically disadvantaged.

## Chapter 5 Addendum

## Item Drift Analysis

Differential, or systematic, change in item parameter values over time is known as item parameter drift. Item drift is problematic because item invariance is a key assumption in item response theory (IRT) scoring. CRESST conducted a study of item parameter drift appearing in the 2014-2015 operational summative tests.

Items were tested for invariance between the initial item calibration study (2013-2014 field test) and the 2014-2015 summative assessment. Only items with at least 1,000 observed scores in the 2014-2015 online administration were evaluated. If the number of observed scores for a particular item exceeded $10,000,10,000$ cases were randomly sampled. For each item that was evaluated, two IRT calibrations were performed. In the first calibration, the parameters of all items in the pool were fixed to their previous estimates. In the second calibration, the parameters of the focal item were freely estimated (while the parameters of all other items in the pool remained fixed). Because items are selected according to an adaptive algorithm, it was assumed that the ability distributions would differ across the groups of students administered different items. Accordingly, the population mean and variance were freely estimated in both calibrations.

Likelihood ratio tests provided a formal evaluation of the null hypothesis that item parameters were exactly equal to their previous estimates. However, this test tends to be quite sensitive (rejecting the null hypothesis for the majority items), and small differences in item parameters may have a negligible impact on item scores. Accordingly, the weighted absolute area between the expected score curves (wABC; see, e.g., Stucky, Edelen, \& Chandra, 2015) was used as the primary criterion for judging the severity of item drift across two operational administrations. Expected score curves were computed from the previous item parameter estimates and the parameters estimated from the 2014-2015 data (the second calibration above).

Overall results, and results across claims and across item types (per grade \& subject), are summarized in Table 5.147 to Table 5.160. Across grades and subjects, no items showed wABC > 0.20 . In all the grades and subjects except for ELA grade 11, the percentage of items with wABC < 0.05 was above $90 \%$. ELA grade 11 had around $74 \%$ of the items with wABC less than 0.05 , and $24 \%$ of the items with wABC between 0.05 and 0.10 . Across item response formats, the short answer ("sa") and writing extended response ("wer") items tended to show higher values of wABC that other item types. However, even for these formats, the average wABC values were quite small.

These results suggest that items functioned quite similarly across the two test administrations (2013-2014 vs. 2014-2015), with only minimal differences in item parameters and the resulting expected score functions.

## Chapter 6: Test Administration

## Introduction

"The usefulness and interpretability of test scores require that a test be administered and scored according to the developer's instructions" (American Educational Research Association [AERA], American Psychological Association [APA], \& National Council on Measurement in Education [NCME], 2014, p. 111). Smarter Balanced created and disseminated a customizable test administration manual (2014c) to ensure standardized test administration procedures and, thus, uniform test administration conditions for all students in Smarter Balanced member states. This chapter describes the customizable Smarter Balanced Online Test Administration Manual; presents operational item exposure rates and blueprint fidelity; and shows results for the embedded field test, including item scoring processes and inter-rater reliability of field tested items.

## Test Administration

Students in Smarter Balanced member states participated in the 2015 test administration when a specified percentage of the school year had occurred. Each state established a schedule for the administration of the Smarter Balanced summative assessments using a testing window as defined below:

Grades 3-8

- Testing shall not begin until at least sixty-six percent (66\%) of a school's annual instructional days have been completed, and
- Testing may continue up to and including the last day of school.

## Grade 11

- Testing shall not begin until at least eighty percent (80\%) of a school's annual instructional days have been completed, and
- Testing may continue up to and including the last day of school.

States were allowed to establish more specific windows within the constraints of the Consortiumdefined windows described above. (Smarter Balanced, 2014c, p. 25)

## Session Time

Table 2.1 presents the estimated testing times. These were provided within the Online Test Administration Manual (Smarter Balanced, 2014c, pp. 25-26). The estimated times for each session of each content area test provides sufficient time for students to attempt all items.

Table 6.1: Estimated testing times for Smarter Balanced assessments

| Content Area | Grades | Computer Adaptive Test (CAT) items hrs : mins | Performance Task (PT) hrs: mins | Total hrs: mins | Classroom Activity (administered prior to the PT)* hrs : mins | Total hrs: mins |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| English <br> Language Arts/Literacy | 3-5 | 1: 30 | 2:00 | 3:30 | :30 | 4:00 |
|  | 6-8 | 1:30 | 2:00 | 3:30 | : 30 | 4:00 |
|  | HS | 2:00 | 2:00 | 4:00 | : 30 | 4:30 |
| Mathematics | 3-5 | 1:30 | 1:00 | 2:30 | : 30 | 3:00 |
|  | 6-8 | 2:00 | 1:00 | 3:00 | : 30 | 3:30 |
|  | HS | 2:00 | 1:30 | 3:30 | : 30 | 4:00 |
| Both | 3-5 | 3:00 | 3:00 | 6:00 | 1:00 | 7:00 |
|  | 6-8 | 3:30 | 3:00 | 6:30 | 1:00 | 7:30 |
|  | HS | 4:00 | 3:30 | 7:30 | 1:00 | 8:30 |

* Classroom Activities are designed to fit into a thirty-minute window; however, the time within the window will vary due to the complexity of the topic and individual student needs.

## Test Administration Manual

The Smarter Balanced Assessment Consortium State Procedures Manual provides a high-level overview of the assessment system, including expected policies and procedures for administration, required trainings, general information about the open source platform, information about the evidence states must provide to Smarter Balanced annually, procurement information, and links to resource documents. This document provides the core responsibilities that member states must assume in order to provide Smarter Balanced test results that are generalizable across states.

Specific instructions for member states to administer Smarter Balanced summative assessments are included in the Test Administrator User Guide (2014i), the Online Test Administration Manual (TAM; 2014c), the Paper Pencil Test Administration Manual for ELA (2014g), and the Pencil Paper Test Administration Manual for Mathematics (2014h). Specific components of these user guides and manuals require customization to meet unique needs in each member state. These components include:

- Help Desk information
- Test expiration dates
- Administration and Registration Tools (ART) user roles
- State user roles
- Test security policy
- Links to where materials and modules are posted
- Test Security/Administration training policy
- Instructions for identifying and retrieving the Classroom Activity
- Role-specific checklists

The development of the Smarter Balanced test administration manuals were guided by the AERA, APA, and NCME 2014 Standards. In regard to test administration, the Standards provide guidance to test developers that the directions for test administration should be sufficiently clear to allow for standardized implementation in a variety of conditions (see Standard 4.15). In addition, the standards provide guidance that test developers should provide sufficient detail so that test takers can respond to items and tasks in the manner intended by the test developer (see Standard 4.16).

## Clear Directions to Ensure Uniform Administration

Smarter Balanced test administration manuals include instructions that clearly articulate various aspects of the administration process. The TAM covers an extensive amount of material for events that occur before, during, and after testing. In addition, the TAM points the user to training materials that further provide detail and clarity to support reliable test administration by qualified test administrators. The details provided in the TAM describe the general rules of online testing, including; pause rules; scheduling tests; recommended order of test administration; classroom activity information; assessment duration, timing, and sequencing information; and the materials that the test administrator and students need for testing. All work together to ensure uniform test administration conditions across Smarter Balanced member states.

Section 8 of the TAM provides an overview of the universal tools, designated supports, and accommodations. All are further explicated in the Smarter Balanced Assessment Consortium Usability, Accessibility, and Accommodations Guidelines and the Usability, Accessibility, and Accommodations Implementation Guide (2014e).

## Detailed Instructions for Test Takers

Section 10 of the TAM provides step-by-step instructions to test administrators (TA) on how to start a test session, monitor a test session, and end a test session. Throughout the steps, Smarter Balanced embedded scripts that TAs are instructed to read to students. Test administrators are instructed to strictly adhere to scripts, use professional judgment when responding to student questions, and refrain from reading test items, suggesting answers, or evaluating student work during testing. See Section 10 of the online TAM for the script (Smarter Balanced, 2014c, pp. 37-45).

In addition, Smarter Balanced provides tutorials and practice tests ${ }^{10}$ for each content area to familiarize students with how to navigate the online test delivery system and practice with the item types and the functionality of the testing environment. Together with the detailed instructions, the tutorials and practice tests assure that students are able to answer the items and tasks in the manner intended by Smarter Balanced.

## Responsibilities of Test Administrators

The AERA, APA, and NCME Standards (2014) also provide guidance to test administrators and test users. Test administrators are guided to carefully follow the standardized procedures (Standard 6.1); inform test takers of available accommodations (Standard 6.2); report changes or disruptions to the standardized test administration (Standard 6.3); furnish a comfortable environment with minimal distractions (Standard 6.4); provide appropriate instructions, practice, and other supports (Standard $6.5)$; and ensure the integrity of the test by eliminating opportunities for test taker malfeasance (Standard 6.6). In addition, test users are responsible for test security at all times (Standard 6.7). To align to these guidelines, the online TAM provides:

- careful direction to TAs to strictly adhere to the directions in the TAM;
- available universal tools, designated supports, and accommodations;
- requirements of the test environment, including student seating, providing a quiet environment, and access to allowable universal tools, designated supports, and accommodations;
- descriptions of testing improprieties, irregularities, and breaches.

Deviations from standardized online testing procedures (specifically testing irregularities and improprieties are handled at the local and/or state level, per the guidelines in the Online TAM. Depending on the nature and severity of the incident, a student's test may be reset, invalidated, reopened, or restored. All such incidents must be reported by authorized administrators at the local level to the state level (Smarter Balanced, 2014c, pp. 15-20).

## Tools, Designated Supports, and Accommodations

To enhance student access to the assessment content during test administration, Smarter Balanced developed a conceptual model that included universal tools, designated supports, and accommodations (2014e, p.4). Universal Tools are access features of the Smarter Balanced assessment that are either provided as digitally-delivered components of the test delivery system (embedded) or provided separately from the test delivery system (non-embedded). Universal tools are available to all students based on student preference and selection. Embedded universal tools include (but are not limited to) such features as a "pause" feature that allows the student to take a break of 20 minutes or less during the assessment; a digital calculator that the student may access by clicking on a calculator button; and a digital notepad. Non-embedded universal tools include (but are not limited to) provision of an English dictionary for the full-write portion of the ELA/literacy performance task and the provision of physical scratch paper for all content area tests.

[^9]Designated supports for the Smarter Balanced assessments are embedded and non-embedded features that are available for use by any student for whom the need has been indicated by an educator or team of educators (along with the student and his/her parent/guardian) familiar with the student's instructional needs. Embedded designated supports include (but are not limited to) such features as color contrast, which enables students to adjust background or font color; translated test directions, translated glossaries, and stacked translations for mathematics items. Nonembedded designated supports include (but are not limited to) provision of color overlays; printing test content with different colors; use of magnification devices; and use of noise buffers.

Accommodations are changes in procedures or materials that increase equitable access during the Smarter Balanced assessments. Students receiving accommodations must have a need for those accommodations documented in an Individualized Education Program (IEP) or 504 accommodation plan. Like universal tools and designated supports, accommodations may be either embedded or non-embedded. Examples of embedded accommodations include (but are not limited to) closed captioning and test content translated into American Sign Language (ASL) video. Non-embedded accommodations include (but are not limited to) use of an abacus, print on demand, and use of an external communication device (speech-to-text). Universal tools, designated supports, and accommodations all yield valid scores that count as participation in assessments that meet the requirements of ESEA when used in a manner consistent with the Smarter Balanced Usability, Accessibility, and Accommodations Guidelines. A complete summary of all embedded and nonembedded universal tools, designated supports, and accommodations is included in the Usability, Accessibility, and Accommodations Guidelines.

## Item Exposure Rates

Item exposure rates were obtained using all completed, online, adaptive tests for which item data were available. The exposure rate for a given item is the proportion of tests (in the grade and content area) on which the item appeared.

Table 2.2 and Table 2.3 presents a summary of the item exposure results for ELA/literacy and mathematics, respectively. Within each grade and component (CAT and PT), both tables present the number of items in the operational pool ( N ), along with various descriptive statistics, including the mean, standard deviation (SD), range (Min, Max), and median of the observed exposure rates. Table 2.2 shows that, on average, the same item appeared in 6\% the Grade 3 tests, or, in other words, $6 \%$ of Grade 3 examinees saw the same item. As a rule of thumb, Smarter Balanced attempts to maintain a maximum exposure rate of $25 \%$ (i.e., $25 \%$ of examinees will see the same item). Table 2.2 shows that the mean and median exposure rates for ELA/literacy items are well below $25 \%$. Table 2.3 shows that the mean and median exposure rates for mathematics items are also well below $25 \%$.

Table 2.4 and Table 2.5 provide further information about the exposure rate by showing the number of items in the operational pool $(\mathrm{N})$ and proportion of items with exposure rates falling into certain ranges (bins with a width of 0.1), including those that were completely unexposed (Unused). Table 2.4 shows the majority of ELA/literacy CAT items had item exposure rates between 0 and $10 \%$. About $60 \%$ of the PT items had item exposure rates between 0 and $10 \%$, while the rest were unused. Table 2.5 shows the majority of mathematics CAT items had item exposure rates between 0 and $10 \%$, and
all of the mathematics PT items had item exposure rates between 0 and $10 \%$, while the rest were unused.

In both content areas, there were a handful of items with high exposure rates. This occurred when there were few items measuring elements in the blueprint. There were also items in both content areas that were unused. The psychometric qualities of these items will be further investigated.

Table 6.2. Summary of ELA/Literacy Item Exposure Rates by Grade and Component (2014-2015 AdMINISTRATION)

| Grade | Type | N | Mean | SD | Min | Max | Median |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 3 | CAT | 618 | . 06 | . 10 | . 00 | . 91 | . 02 |

## Blueprint Fidelity

A key design document of the summative assessments is the test blueprint, which specifies the number and nature of items to be administered. In June 2015, Smarter Balanced conducted a simulation study to examine the blueprint fulfillment for the simulated test. The results of the simulation study are discussed in Chapter 2. A blueprint fidelity study is planned using operational data from the 2016 administration.

Simulations were conducted for both ELA/literacy and mathematics and in all the tested grade levels (3-8 and high school). At each grade level, two ELA/literacy item pools were evaluated: the general pool and the Braille pool. For mathematics, the evaluation in each grade level included general and Braille pools, as well as a Spanish-translated pool. The simulated tests included both the computerized adaptive test (CAT) and performance task (PT) components, thus mimicking the operational summative tests.

For the vast majority of simulees, the CAT engine used in this simulation study was able to satisfy the requirements of the operational blueprints for the CAT component. Satisfying the blueprint with respect to the PT portion, however, was at times more challenging due to a lack of correspondence between stimuli (and the component items) and the blueprint.

## Spring 2015 Embedded Field Test Results

Field test items are embedded into the operational administration during the CAT session. This section presents the analyses of the machine-scored (e.g., multiple choice, equation response) and
hand-scored (e.g., short text) field test items that were embedded during the 2015 test administration.

## Machine-Scored Items

Nearly 10,000 machine-scored field test items were administered to students during the 2015 test administration. Table 2.6 presents the number of machine-scored field test items administered at each grade level.

Table 6.6. Number of Machine-Scored, Field Test Items Administered by Grade, Spring 2015

| Grade | ELA | Math |
| :---: | :---: | :---: |
| 3 | 656 | 564 |
| 4 | 638 | 661 |
| 5 | 646 | 617 |
| 6 | 639 | 676 |
| 7 | 639 | 681 |
| HS | 616 | 695 |
| Total | 2145 | 920 |

## Classical Test Analyses

Using the procedures detailed in Chapter 5, classical item statistics were calculated for all field test items. Table 2.7 and Table 2.8 present the average item score ( $p$-value) and the average item-total correlation (point biserial) for all grades in ELA/literacy and mathematics. Table 2.7 shows that average ELA/literacy item score were in the mid-0.3 range for all grade levels, indicating that, on average, the items were difficult for the students. Table 2.7 also shows that the average item-total correlations tended to be in the 0.4 range, indicating that the items tend to differentiate between high and low ability study.

Table 2.8 presents the same information for the mathematics items. The average mathematics item score ranged from a low of 0.19 in Grade 11 to a high of 0.40 in Grade 3, indicating that the items tended to be difficult for students. The mean item-total correlations ranged from 0.49 in Grade 8 to 0.62 in Grade 11.

Table 6.7. Classical Item Statistics for ELA/Literacy Field Test Items, Spring 2015

| Grade | Number of <br> Items | Average Item Score |  | Item-Total* Correlation |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Mean | SD | Mean | SD |
| 3 | 656 | 0.35 | 0.19 | 0.48 | 0.16 |
| 4 | 638 | 0.34 | 0.20 | 0.45 | 0.16 |
| 5 | 646 | 0.38 | 0.22 | 0.45 | 0.17 |
| 6 | 639 | 0.34 | 0.20 | 0.41 | 0.17 |
| 7 | 639 | 0.31 | 0.20 | 0.41 | 0.18 |
| 8 | 616 | 0.35 | 0.21 | 0.41 | 0.17 |
| 11 | 2145 | 0.36 | 0.20 | 0.42 | 0.18 |

Table 6.8. Classical Item Statistics for Mathematics Field Test Items, Spring 2015

| Grade | Number of <br> Items | Average Item Score |  |  | Item-Total* Correlation |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Mean | SD |  | Mean | SD |
| 3 | 564 | 0.40 | 0.22 |  | 0.54 | 0.17 |
| 4 | 661 | 0.38 | 0.21 |  | 0.58 | 0.15 |
| 5 | 617 | 0.36 | 0.18 |  | 0.56 | 0.17 |
| 6 | 676 | 0.29 | 0.20 |  | 0.53 | 0.19 |
| 7 | 681 | 0.23 | 0.17 |  | 0.54 | 0.21 |
| 8 | 695 | 0.27 | 0.20 |  | 0.49 | 0.22 |
| 11 | 920 | 0.19 | 0.17 |  | 0.62 | 0.20 |

*Total is scale score computed from operational items

## Item Review

The item-level statistics for machine-scored field test items were examined and flagged for data review with the following criteria:

Flags based on item difficulty and score distribution

- low average item score (less than .10)
- high average item score (greater than .95)
- proportion obtaining any score category <0.03

Flags based on item discrimination

- low item-total correlation (less than .30)
- higher mean criterion score for students in a lower score-point category

Flags for multiple choice items

- among higher ability students (top $20 \%$ on overall score), more select a distractor than select the key
- higher criterion score mean for students choosing a distractor than the mean for those choosing the key
- positive correlation between distractor and total score

Table 2.9 and Table 2.10 show the number of items flagged based on difficulty and score distribution for ELA/literacy and mathematics, respectively. For ELA/literacy, about 33\% of items (28$39 \%$ across the grade levels) were flagged based on at least one criterion. For mathematics, about $35 \%$ of items (17-50\% across the grade levels) were flagged based on at least one criterion.

Table 6.9. Number of ELA/Literacy Field Test Items Flagged Based on Difficulty and Score DIStribution, Spring 2015

| Grade | Number of <br> Items | Average Item Score |  | Item-total <br> $r<0.30$ | $<3 \%$ in any <br> score level |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $<0.10$ | $>0.95$ |  | 30 |
| 4 | 656 | 67 | 0 | 101 | 35 |
| 5 | 646 | 74 | 0 | 107 | 29 |

| 7 | 639 | 90 | 0 | 169 | 38 |
| 8 | 616 | 70 | 0 | 136 | 28 |
| 11 | 2145 | 235 | 0 | 479 | 69 |

Table 6.10. Number of Mathematics Field Test Items Flagged Based on Difficulty and Score Distribution, Spring 2015

| Grade | Number of <br> Items | Average Item Score |  | Item-total <br> $r<0.30$ | $<3 \%$ in any <br> score level |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $<0.10$ | $>0.95$ |  | 8 |
| 3 | 564 | 39 | 0 | 65 | 8 |
| 4 | 661 | 54 | 0 | 37 | 8 |
| 5 | 617 | 45 | 1 | 50 | 6 |
| 6 | 676 | 117 | 0 | 94 | 32 |
| 7 | 681 | 173 | 0 | 112 | 49 |
| 8 | 695 | 166 | 0 | 140 | 54 |
| 11 | 920 | 359 | 0 | 79 | 148 |

## Differential Item Functioning

Using the procedures detailed in Chapter 3, DIF statistics were computed for all field test items. DIF was evaluated for eight subgroup comparisons (focal - reference)

- Gender: Female - Male
- Race/Ethnicity: Asian - White
- Race/Ethnicity: Black - White
- Race/Ethnicity: Hispanic - White
- Race/Ethnicity: Native American - White
- IEP: yes - no
- LEP: yes - no
- Title 1: yes - no

DIF categories/grades assigned based on Mantel-Haenszel chi-square and delta-DIF statistics and standardized mean effect sizes:

- A: negligible
- B: slight to moderate
- C: moderate to large

Table 2.11 and Table 2.12 summarizes the number of items flagged for DIF by grade in ELA/literacy and mathematics, respectively. The third column shows the number of items flagged for any
moderate to large DIF (C DIF). Table 2.11 shows that just about 5\% of ELA/literacy items were flagged for moderate to large DIF. Table 2.12 shows that right around $5 \%$ of mathematics items were flagged for moderate to large DIF.
Table 6.11. Number of ELA/Literacy Field Test Items Flagged for DIF, Spring 2015

| Grade | items | Any C | DIF | M/F | A/W | B/W | H/W | NA/W | IEP/no | LEP/no | Title1/no |

## Hand-Scored Items

Approximately 400 hand-scored items were administered and scored for the Spring 2015 embedded field test. This section provides an overview of the scoring procedures as well as the results of the scoring process.

## Scoring Procedures

For the purpose of ensuring standardized scoring processes and standards, Smarter Balanced developed and implemented detailed training requirements, qualification standards, and scoring quality standards for all hand scored items. For field test hand-scoring, training procedures differed based on content area and item type. For the ELA/literacy PT (full write), readers were trained using anchor sets for a specific trait at a specific grade level. For ELA/literacy short text items, readers were trained by grade band for a claim and target subcategory. For mathematics PTs and short text items, training was based on task models. Qualification standards were determined by the number of points available within a specific item as follows:

| Item Points <br> Available | Qualification Standard |
| :---: | :---: |
| $0-1$ | $90 \%$ (no non-adjacent <br> scores) |
| $0-2$ | $80 \%$ (no non-adjacent <br> scores) |
| $0-3$ | $80 \%$ (no non-adjacent <br> scores) |
| $0-4$ | $70 \%$ (no non-adjacent) |

For field test scoring, a minimum of ten validity papers per item was presented to each reader with the expectation that the reader would maintain the following exact agreement standards:

| Item <br> Points <br> Available |
| :--- |
| $0-1$ |
| $0-2$ |
| $0-3$ |

Scoring supervisors reviewed quality data including inter-rater reliability, validity check-set results, third-read adjudication results, item-level and reader-level reports on item score-point frequencies, and item-level reports showing mean scores throughout the scoring event includes a detailed description of the hand scoring process, the rater qualifications, quality monitoring procedures, and rater training information.

## Interrater Reliability Results

At least $10 \%$ of the field test responses in ELA/literacy and mathematics were scored independently by a second reader. The statistics for the inter-rater reliability were calculated for all items at all grades. To determine the reliability of scoring, the percentage of perfect agreement and adjacent agreement between the two readers was examined. Additionally, the item-level quadratic weighted kappa statistic was calculated to reflect the level of improvement beyond the chance level in the consistency of scoring.

Polytomous items are flagged for elimination if any of the following conditions occur:

- Adjacent agreement < 0.80
- Exact agreement < 0.60
- Quadratic weighted Kappa < 0.20

Dichotomous items are flagged for elimination if any of the following conditions occur:

- Exact agreement < 0.80
- Quadratic weighted Kappa < 0.20

Table 13 shows the number of items flagged by subject and grades. There were 10 items flagged across all grades in the two content areas.

Table 6.13. Number of Hand-scored Field Test Items Flagged by Subject Area and Grade, Spring 2015

| Subject | Grade | Number of Flagged <br> Items |
| :--- | :---: | :---: |
| ELA/Literacy | 3 | 1 |
| ELA/Literacy | 6 | 1 |
| Mathematics | 7 | 4 |
| Mathematics | 8 | 2 |
| Mathematics | 11 | 2 |

## Spring 2015 Embedded Field Test Results

A large proportion of items were successfully field tested and met statistical criteria. With the exception of grade 11 mathematics, where about half of the items were flagged, a majority of items are eligible for use in operational pools without additional review. The flagged items will undergo editorial and data review by panels composed of both content and bias/sensitivity experts. Based on the recommendation of the reviewers, flagged items will either be approved for operational use, rejected, or revised and moved to back to the field test pool.

Smarter item pools tend to be difficult. The consortium is undertaking a project to examine items at all levels of difficulty to assess differences associated with difficulty.

## Chapter 7: Reporting and Interpretation

## Introduction

Scores from summative assessments provide information about student achievement with regard to college and career readiness. As noted in chapters on test design and scoring, summative tests provide an overall indicator of proficiency and a set of sub-scores corresponding to broad areas within the content area domains. The consortium provides a set of reports based on these scores and sub-scores that members may customize for their own use. This chapter provides an overview of the report system. For detailed information, consult the Smarter Balanced Reporting System User Guide (Smarter Balanced, 2014). Since use of the Smarter Balanced reporting system is optional and configurable, information about a specific member's reports should be gathered from member websites and materials. Smarter Balanced reports are based on information provided in the output of the test scoring algorithm. Overall scores and sub-scores each have an associated standard error of measurement (SEM) that indicates the reliability of the score. (For a fuller explanation of the SEM, refer to Chapter 2.)

## Overall Test Scores

Scale scores are the basic units of overall reporting. These scores fall along a continuous vertical scale (from approximately 2000 to 3000) that increases across grade levels and are used to describe an individual student's current level of achievement. (They will also be used to track growth over time, but in this first implementation year, there are no growth reports.) When aggregated, scale scores are used to describe achievement for different groups of students. The method for setting achievement level criteria so that cut scores delineate proficiency levels is explained in Chapter 5.

The Smarter Balanced reporting system communicates an overall scale score in relation to Achievement Levels using graphics similar to Figure 7.1. By default, the system uses generic terms for the achievement levels, Level 1, Level 2, Level 3, and Level 4, but members may customize them using terms such as "novice, developing, proficient, advanced" or others.

Figure 7.1 Portrayal of score reporting levels. From Reporting System User Guide, p.13.

Scale scores are reported with an error band based on the SEM. In Figure 7.1, the overall score is 2475, which is in Level 2, and the score's error band encompasses Level 3. Smarter Balanced reporting provides information to help users understand the meaning of the error bands, as shown in Figure 7.2.

Figure 7.2 Explanation of error bands displayed on Smarter Balanced reports. From Reporting System User Guide, p. 120.

Smarter Balanced tests provide the most precise scores possible within a reasonable time limit, but no test can be 100 percent accurate. The error band indicates the range of scores that a student would likely achieve if they were to take the test multiple times. It is similar to the "margin of error" that newspapers report for public opinion surveys.

Depicting errors and error bands in score reporting is an important measurement principle. In this portrayal, the score is represented by the vertical line and black triangle. The error band is shown by the brackets. If the test were to be given again, the score is likely to fall within this band.

Smarter Balanced has developed a set of optional Reporting Achievement Level Descriptors (ALDs) for English language arts/literacy (ELA/literacy) and mathematics that are aligned with the Common Core State Standards (CCSS) and Smarter Balanced assessment claims. The intent of these descriptors is to specify, in content terms, the knowledge and skills that students may display at four levels of achievement. The full set of optional Reporting ALDs are shown in Appendix C.

## Sub-scores

Sub-scores are scores on important domain areas within each content area. In most case, subscores correspond to Claims, but in mathematics, Claims 2 and 4 are so intertwined that they are reported as a single sub-score. The Claims and reporting categories (sub-scores) are primary structural elements in test blueprints and item development. Tables 7.1 and 7.2 provide the claims or sub-score reporting categories for ELA/literacy and mathematics.

Table 7.1 English Language Arts/Literacy claims

## Claim \#1- Reading

- Students can read closely and analytically to comprehend a range of increasingly complex literary and informational texts.

## Claim \#2- Writing

- Students can produce effect and well-grounded writing for a range of purposes and audiences. Claim \#3- Speaking and Listening
- Students can employ effective speaking and listening skills for a range of purposes and audiences. At this time, only listening is assessed.

## Claim \#4- Research

- Students can engage in research /inquiry to investigate topics and to analyze, integrate, and present information.

Table 7.2 Mathematics claims and score reporting categories

## Claim \#1- Concepts and Procedures

- Students can explain and apply mathematical concepts and interpret and carry out mathematical procedures with precision and fluency.

## Claim \#2- Problem Solving/ Claim \#4- Modeling and Data Analysis

- Students can solve a range of complex well-posed problems in pure and applied mathematics, making productive use of knowledge and problem solving strategies. Students can analyze complex, real-world scenarios and can construct and use mathematical models to interpret and solve problems
- Students can analyze complex, real-world scenarios and can construct and use mathematical models to interpret and solve problems

## Claim \#3- Communicating Reasoning

- Students can clearly and precisely construct viable arguments to support their own reasoning and to critique the reasoning of others.

Achievement levels for claims are not established, so sub-scores are not portrayed in achievement levels. In addition, SEMs at the claim/sub-score level are fairly large. Consequently sub-scores are characterized by an indication of whether they are "Below Standard", "At or Near Standard", or "Above Standard". These designations are based on the SEM of the sub-score and the distance of the sub-score from the cut score between levels 2 and 3 , which is an indicator of being on-track for college or career readiness. If the Level $2 / 3$ cut score falls within a 1.5 SEM error band, it is designated as "At or Near Standard". If the Level $2 / 3$ cut score is above the error band, the subscore is designated as "Below Standard"; if the cut score is below the error band, the sub-score is "Above Standard".

Table 7.3 sub-score categories

| Above Standard | Score is $>1.5$ SEMs above the Level 2/3 cut <br> score |
| :--- | :--- |
| At or Near <br> Standard | The Level $2 / 3$ cut score falls within an error <br> band of $+/-1.5$ SEMs around the sub-score |
| Below Standard | Score is $>1.5$ SEMs below the Level $2 / 3$ cut <br> score |

A practical way to understand this is portrayed in the graphic below. Instead of using error bands, it shows the reporting level area that would result from a scale score and SEM.

Figure 7.3 Portrayal of sub-score reporting. From Reporting System User Guide, pp.116-117.

Although sub-scores are portrayed in Smarter Balanced reports by the three-level system above (also called "traffic-light" indicators) sub-score scale scores and SEMs are available to members in the data provided from the test scoring system. Members may use these in local reporting systems.

## Types of Reports

The Smarter Balanced reporting system is an interactive, online reporting platform that provides a range of reports. Members can log into the system to create reports. Members can configure the system to show a state or groups logo or test name and can use their own labels for achievement levels. They can also use their own student groups. There are three basic report types: Individual student reports (ISRs), lists, and aggregate reports. These will be described briefly here, but the reader is urged to consult the Smarter Balanced Reporting System User Guide for more detail.

## Individual Student Report (ISR)

Theses report presents individual student assessment scores, SEMs and achievement levels. They also display the reporting levels for claim/sub-score results along with claim level ALDs. The scores and descriptions provide context for understanding what the assessment has measured and how to interpret the scores and sub-scores. Teachers, students and parents use this report to understand a student's achievement and progress toward mastery of the CCSS. The report may be part of a larger set of information to provide context for instructional focus. In addition to the overall score displays, sub-scores are reported as shown in Figure 7.4 below.

Figure 7.4 ILLUSTRATION OF SUB-SCORE REPORTING ON INDIVIDUAL STUDENT REPORTS

Individual Student Reports can be downloaded as PDF files for easy printing and distribution to parents.

## Lists

Lists are generated for available groups. They are most commonly used at the school or district level, but may be used for other groupings if these are available to the system. Teachers and administrators commonly use lists to identify patterns across groups or to identify students most in need of assistance. Along with other information, lists can be used to provide a direction for further investigation about instructional emphasis or to aid in resource allocation. Figure 7.5 is an extract of a typical list report that presents a compact display of scores, errors, achievement categories and sub-score levels. Note that lists can be filtered and sorted for different purposes. They may be filtered by gender or student demographic data (e.g. LEP, Race/Ethnicity, IEP, Gender, 504, Economic Disadvantage, or Migrant Status), or based on the completeness or validity of student test attempts.
Figure 7.5 EXAMPLE LIST

## Aggregate Reports

Group aggregate reports provide score data at the state, district, school, and grade level. Educators may examine data at multiple levels, depending on their level of access, and can create custom subsets filtered in the same ways as list reports. Aggregate reports can be viewed onscreen or downloaded as CSV files that can be used in other reporting systems or combined with other data. In the Smarter Balanced reporting system aggregate reports show how groups are distributed across the four achievement levels. They are usually used to compare among groups or to identify areas of resource need. Like the reports above, aggregate reports can be filtered.

Figure 7.6 shows a district-level report with overall district results at the top and school results below. The shaded areas correspond to the achievement levels. Percentages of students in each level are shown. The figure shows the window that pops up when the cursor hovers over the display. It shows the numbers of students in each category as well as percentages.

Figure 7.6 Example Aggregate report

## Data Downloads

In addition to the predesigned reports, the reporting system offers authorized users the ability to download data for distribution or further review and analysis in external systems. User authorization is closely controlled for ISRs and personally identifiable information (PII) in files. The list of available data downloads appears below. Note that these downloads assume that members have loaded data into the Smarter Balanced Data Warehouse. In practice, many members get this information directly from test delivery service providers and do not go through the Data Warehouse.

## Figure 7.7DATA DOWNLOAD OPTIONS

| Download Type | Description |
| :--- | :--- |
| Student Assessment <br> Results | This is a bulk download of the assessment results for the selected <br> assessment, with one row per student-assessment. The resulting files <br> contain all of the data for Overall and Claim scores (e.g., scale score, <br> error band, level determination), as well as all the student data (e.g., <br> demographics, grade/school/district/state attribution, etc.) for the <br> specific summative or interim assessment being viewed. |
| Printable Student <br> Reports | Printable versions of list and aggregate reports |
| State Download: <br> Student Registration <br> Statistics | This download shows statistics of registration records for a specified <br> academic year and compares them to those of previous years to detect <br> errors. This download is primarily intended for Consortium, state, and <br> district administrators. |
| State Download: <br> Assessment Completion <br> Statistics | For a specified assessment administration, this download provides <br> counts of registered and assessed students and percentages of <br> students assessed. This enables an administrator to review how many <br> of the registered students have been assessed. |
| State Download: Audit <br> XML | This download ensures that all information for a given student <br> assessment is maintained, including usage reports for Universal Tools <br> and Designated Supports, as well as any additional data provided by a <br> Test Delivery System |

## Summary

Smarter Balanced reports tie together report categories, Achievement Levels, and optionally the Reporting Achievement Level Descriptors to provide coherent information about student progress. Reporting categories are based on test structure which in turn reflects close analysis of the CCSS. In addition, the Smarter Balanced scale and Achievement Levels were set by the comprehensive process described in Chapter 5.

The dynamic nature of the reports, allowing users to sort and filter to get custom information and the provision of customized download data for any kind of analysis, gives Consortium members a rich flexible set of results. By providing capability for multiple reports and downloads, the Smarter Balanced system affords members with a dynamic and flexible system.

## Appendix A: Item Development Process

The charts below outline the detailed process for stages of item development. They describe the many checks and reviews each item receives before it is approved for field testing. Item content, graphics, artwork, response processes and stimuli get extensive reviews. Items are also subject to reviews for possible cultural bias or material that may distract some test takers because it is in an area of sensitivity. Throughout the process there are checks to assure that items are accessible to as many students as possible.

## Appendix B: Test Design Development Activity and Outcomes

Major types of assessment design specifications that did not necessarily occur sequentially are summarized below that fall generally under the rubric of test design. These steps primarily relate to content validity of the Smarter Balanced assessments, particularly with respect to nonstandard administrations. Other test specifications concern the establishment of achievement level descriptors and psychometric specifications that pertain to scaling and implications for scores. In many cases, the results were reviewed by one or more Stakeholder groups.

1) Conducted Initial Analysis of the Content and Structure of the CCSS

An initial analysis of how each standard within the CCSS could be assessed in terms of item/task type and DOK was conducted. This was intended to support content and curriculum specialists and test- and item/task-development experts. Analysis and recommendations were made for all ELA/literacy and mathematics standards in grades 3 to 8 and high school. Multiple levels of review were conducted that included the Smarter Balanced Technical Advisory Committee, Smarter Balanced member states, and Smarter Balanced Executive Committee.
2) Developed Content Specifications for ELA/literacy and Mathematics

Content specifications (e.g., claims, inferences, and evidence), item/task development criteria, and sample item/task sets were developed. This was intended to support the development of test blueprints and test specifications. Key constructs underlying each content area and critical standards/strands were identified in terms of demonstrating evidence of learning. Standards and bundled standards based on "bigger ideas" within the CCSS that require measurement through non-selected-response items (e.g., innovative item types) were identified. Reviews were conducted by CCSS authors, content experts, and assessment specialists.
3) Specified Accessibility and Accommodations Policy Guidelines

Guidelines that describe the accessibility and accommodations framework and related policies for test participation and administration were created that incorporated evidence-based design (ECD) principles and outcomes from small-scale trials. State survey and review of best practices were reviewed as well as recommendations on the use of assessment technology. Input was solicited from the Smarter Balanced English Language Learners Advisory Committee and the Students with Disabilities Advisory Committee.
4) Developed Item and Task Specifications

Smarter Balanced item/task type characteristics were defined as sufficient to ensure that content measured the intent of the CCSS and there was consistency across item/task writers and editors. This included all item types, such as selected-response, constructed-response, technology-enhanced, and performance tasks. In addition, passage/stimulus specifications (e.g., length, complexity, genre) and scoring rubric specifications for each item/task type were included. Specifications for developing items for special forms (e.g., braille) were also included.
5) Developed and Refined Test Specifications and Blueprints

The test form components (e.g., number of items/tasks, breadth and depth of content coverage) necessary to consistently build valid and reliable test forms that reflect emphasized CCSS content were defined. These specifications included purpose, use, and validity claims of each test, item/task, test form, and CAT attribute. These were reviewed and revised based on CAT simulation studies, small-scale trials, Pilot and Field testing, and as other information was made available.
6) Developed Initial Achievement Level Descriptors

Achievement expectations for mathematics and ELA/literacy were written in a manner that students, educators, and parents could understand. Panelists were recruited, and panels consisting of Institutes of Higher Education and a Cross-Consortia Technical Advisory Committee were convened in order to define college and career readiness. A period for public comment and various levels of review was implemented by the Smarter Balanced Technical Advisory Committee and selected focus groups with the approval of Governing Members. These activities were coordinated with the PARCC consortium.
7) Developed Item and Task Prototypes

Prototype items and tasks using accessibility and Universal Design principles were produced that maximize fairness and minimize bias by using the principles of evidence-based design. Recommendations were made on how best to measure standards for innovative item types (per content specifications). This included prototypes for scoring guides, selected-response items, constructed-response items, and performance tasks. These prototypes were annotated, describing key features of items/tasks and scoring guides, passage/stimulus specifications (e.g., length, complexity, genre), and scoring rubric guidelines for each item/task type. Reviews, feedback, and revisions were obtained from educator-focus groups and Stakeholders, Smarter Balanced work groups, the Smarter Balanced English Language Learners Advisory Committee, and the Students with Disabilities Advisory Committee.
8) Wrote Item and Performance Task Style Guide

The style guide specifies item/task formatting sufficient to ensure consistency of item/task formatting and display. The style guide specified the font, treatment of emphasized language/words (e.g., bold, italics), screen-display specifications, constraints on image size, resolution, colors, and passage/stimulus display configuration. Comprehensive guidelines for online and paper style requirements for all item types (e.g., selected-response, constructedresponse, technology-enhanced, performance tasks) were specified.
9) Developed Accessibility Guidelines for Item and Task Development

Guidelines were produced for item and task writing/editing that ensure accessibility of test content that addressed all item types. Interoperability standards at the item and test level were determined. Reviews, feedback, and revisions were based on educator-focus groups, Smarter Balanced work groups, the Smarter Balanced English Language Learners Advisory Committee, and the Students with Disabilities Advisory Committee.
10) Developed and Distributed Item/Task Writing Training Materials

Training materials were created that specified consistent use of item/task specifications, style guides, accessibility guidelines, and best practices in item/task development (e.g., Universal Design, bias and sensitivity concerns) that were sufficient to ensure valid and reliable items/tasks that are free from bias and maximize accessibility to content. Training for item/task writing and editing was developed as online modules that enabled writers and editors to receive training remotely. Item writer and editor qualifications were established, and quality control procedures to ensure item writers were adequately trained were implemented.
11) Reviewed State-Submitted Items and Tasks for Inclusion in Smarter Balanced Item Pool

State-submitted items/tasks were reviewed for inclusion in the Pilot and/or Field Test item bank using the item bank/authoring system. This consisted of developing protocols for the submission and collection of state-submitted items/tasks for potential use in Pilot or Field Tests. These items were reviewed for item/task alignment, appropriateness (including access), and bias and
sensitivity. Feedback was provided to states on the disposition of submitted items/tasks, and a gap analysis was conducted to determine the item/task procurement needs.
12) Planned and Conducted Small-Scale Trials of New Item and Task Types

Small-scale trials of new item/task types were used to inform potential revision of item/task specifications and style guides. Cognitive labs were conducted for new item/task types. Smallscale trials reflected an iterative development process, such that recommended revisions were evaluated as improvements became available.

## 13) Developed Automated-Scoring Approaches

The initial automated scoring methodology (e.g., regression, rules-based, or hybrid) was based on information from the content specifications, item/task specifications, item/task prototypes, and response data from the small-scale item/task trials. Reports documenting analysis were created, and independent review of this information with recommendations was made. Consultation, review, and approval of recommendations by the Smarter Balanced Technical Advisory Committee were made.
14) Developed Smarter Balanced Item and Task Writing Participation Policies and Guidelines

Documentation of processes for Smarter Balanced member states and Stakeholders to be involved in Smarter Balanced item/task writing activities (e.g., content and bias/sensitivity, data review, Pilot Testing, Field Testing) was developed. Criteria for selecting committee members (e.g., regional representation, expertise, experience) were also made.
15) Developed Content and Bias/Sensitivity Pilot Item and Task Review Materials

Methods for consistent training for content- and bias-review committees and for meeting logistics guidelines were provided. Review committees were recruited consistent with Smarter Balanced assessment participation policies.
16) Conducted Content and Bias/Sensitivity Reviews of Passages and Stimuli

Feedback from educators and other Stakeholders regarding passage/stimulus accuracy, alignment, appropriateness, accessibility, conformance to passage/stimulus specifications and style guides, and potential bias and sensitivity concerns was obtained. Educator feedback was documented, and procedures for feedback-reconciliation review were made.
17) Conducted Content and Bias/Sensitivity Pilot and Field Item and Task Review Meetings

Feedback from educators and other Stakeholders regarding item/task accuracy, alignment, appropriateness, accessibility, conformance to item/task specifications and style guides, and potential bias and sensitivity concerns was obtained. Reviews included all aspects of items/tasks (stem, answer choices, art, scoring rubrics) and statistical characteristics.
18) Developed Translation Framework and Specifications Languages

Definitions of item/task translation activities that ensure consistent and valid translation processes consistent with Smarter Balanced policy were produced. Review and approval of this process by the ELL Advisory Committee was made.
19) Translated Pilot and Field Test Items and Tasks into Identified Languages

Items/tasks translated into the specified languages were edited in sufficient quantity to support both Pilot- and Field-testing and operational assessments. Items/tasks included a full array of Smarter Balanced item types (selected-response, constructed-response, technology-enhanced, performance tasks). Review for content and bias/sensitivity of item/tasks and passages/stimuli was conducted.

## 20) Developed Content and Bias/Sensitivity Field Test Item and Task Review Materials

Supporting materials that ensure consistent training for content- and bias-review committees and meeting logistics guidelines were developed.
21) Revised Field Test Items and Tasks Based on Content and Bias/Sensitivity Committee Feedback

Fully revised items/tasks were available to be included on Field Test forms. Review panels were identified and convened, and training of state-level staff to edit and improve items/tasks that included all aspects of items/tasks (e.g., art, scoring rubrics) was conducted.
22) Developed Translation Framework and Specifications Languages

Definitions of item/task translation activities that ensured consistent and valid translation processes consistent with Smarter Balanced policy were created and approved by the ELL Advisory Committee.
23) Translated Pilot and Field Test Items and Tasks into Identified Languages

Translated items/tasks written by vendors, teachers, or provided through state submissions were edited in sufficient quantity to support Pilot and Field Tests and operational assessment.
24) Developed Content and Bias/Sensitivity Field Test Item and Task Review Materials

Review materials that ensure consistent training for content- and bias-review committees and meeting logistics guidelines were created. Feedback from educators and other Stakeholders regarding item/task accuracy, alignment, appropriateness, accessibility, conformance to item/task specifications and style guides, and potential bias and sensitivity concerns was obtained.
25) Produced a Single Composite Score Based on the CAT and Performance Tasks

A dimensionality study was conducted to determine whether a single sale and composite score could be produced or if separate scales for the CAT and performance task components should be produced. Based on the Pilot Test, a dimensionality study was conducted and the results presented to the Smarter Balanced Technical Advisory Committee. A unidimensional model was chosen for the Smarter Balanced scales and tests.
26) Investigated Test Precision for the CAT Administrations

An investigation of targets was conducted for score precision in the case in which tests are constructed dynamically from a pool of items and a set of rules must be established for the adaptive algorithm. A number of supporting simulation studies were conducted. The findings were used to inform subsequent test design for the operational CAT that was presented to the Smarter Balanced Technical Advisory Committee.

## 27) Selected IRT Models for Scaling

Using the Pilot Test data, the characteristics of various IRT models for selected- and constructedresponse items were compared. The results of this study were presented to the Validation and Psychometrics/Test Design Work Group and the Smarter Balanced Technical Advisory Committee for comment. The two-parameter logistic (2-PL) model for selected-response and the Generalized Partial Credit (GPC) Model for constructed-response were chosen as the scaling models.

## Appendix C: Reporting Achievement Level Descriptors

Descriptors for Smarter Balanced achievement levels provided to Consortium members for the 2014-2015 test administration. Please note that members may choose to alter the descriptors or name the four achievement levels.

Assessment Consortium
Enclosed are the Achievement Level Descriptors for the English language arts/literacy and mathematics Smarter Balanced assessments. Please note states may choose to alter the descriptions or name descriptors.

## Mathematics Reporting Achievement Level Descriptors

| High School | Grades 6-8 | Grades 3-5 |
| :---: | :---: | :---: |
| Level 4 <br> The student has exceeded the achievement standard and demonstrates the knowledge and skills in mathematics needed for likely success in entry-level credit-bearing college coursework after high school. | Level 4 <br> The student has exceeded the achievement standard and demonstrates advanced progress toward mastery of the knowledge and skills in mathematics needed for likely success in entry-level credit-bearing college coursework after high school. | Level 4 <br> The student has exceeded the achievement standard and demonstrates advanced progress toward mastery of the knowledge and skills in mathematics needed for likely success in future coursework. |
| Level 3 <br> The student has met the achievement standard and demonstrates progress toward mastery of the knowledge and skills in mathematics needed for likely success in entry-level credit-bearing college coursework after completing high school coursework. | Level 3 <br> The student has met the achievement standard and demonstrates progress toward mastery of the knowledge and skills in mathematics needed for likely success in entry-level credit-bearing college coursework after high school. | Level 3 <br> The student has met the achievement standard and demonstrates progress toward mastery of the knowledge and skills in mathematics needed for likely success in future coursework. |
| Level 2 <br> The student has nearly met the achievement standard and may require further development to demonstrate the knowledge and skills in mathematics needed for likely success in entry-level credit-bearing college coursework after | Level 2 <br> The student has nearly met the achievement standard and may require further development to demonstrate the knowledge and skills in mathematics needed for likely success in entry-level credit-bearing college coursework after | Level 2 <br> The student has nearly met the achievement standard and may require further development to demonstrate the knowledge and skills in mathematics needed for likely success in future coursework. |

Assessment Consortium
